SUGGESTED CITATION

U.S. Bureau of the Census, Current Population Reports, Series P-23, No. 42, The Social and Economic Status of the Black Population in the United States, 1971 U.S. Government Printing Office, Washington, D.C. 1972.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, \$1.25. Current Population Reports issued in Series P-20, P-23, P-25, P-26, P-27, P-28 (summaries only), P-60, and P-65 are sold as a single consolidated subscription at \$14.00 per year, \$3.50 additional for foreign mailing.

PREFACE

This report was prepared by Nampeo D. R. McKenney, Population Division, with the assistance of Olga V. Fonville, Virginia H. Williams, and Patricia A. Johnson.

Sandra L. Parker and Camilla A. Brooks, Statistical Methods Division, supervised the statistical review of the report. Clerical assistance was provided by Mary B. Williams, Population Division, and editorial assistance by Helen Bonkoski, Publications Services Division, and Louise Douglas, Population Division.

Special acknowledgment is due the staff members of the Bureau of the Census who provided critical comments and review.

Appreciation is expressed to the personnel of several government and private agencies who contributed data willingly and with outstanding judgment. The agencies are Bureau of Labor Statistics, Civil Service Commission, Department of Health, Education, and Welfare, Equal Employment Opportunity Commission, and the Joint Center for Political Studies.

Cover photographs were furnished by Scurlock Studios.

NOTES

The majority of the statistics in this report are from the Bureau of the Census, but some are from other government and private agencies. Specific sources for statistics are given in the section "References for Selected Tables." Unless otherwise noted, the data are from the Current Population Survey.

The 1970 data from the Census Bureau are from the 1970 Census of Population and Housing and Current Population Surveys (CPS). The 1970 census figures in this report for the same items may vary slightly in different tables because they are derived from different tabulations.

Data from the March 1972 Current Population Survey shown in the tables on income (and poverty) and family composition (tables 16, 19, 25-28 and 78) are tied in with figures using 1970 census-based population controls. As such they are not always comparable to figures for earlier years. Specific instances in the tables are footnoted accordingly. For a fuller discussion of the changes in the 1972 Current Population Survey see "Revisions in Current Population Survey," Employment and Earnings, Vol. 18, No. 8, and forthcoming Current Population Reports--Series P-60 reports on Income and Low Income and Series P-20 report on Households and Families.

In this report, the term "Negro and other races" describes persons of all races other than white. In both text and tables the term "Black" or "Negro" is used only when the relevant data are available exclusively for Negroes. The term "Negro and other races" is used whenever data for blacks alone are not available over the period of time shown. Generally, statistics for the national population of Negro and other races reflect the condition of the black population, since about 90 percent of the population of Negro and other races is black.

Data on income covers money income only, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interests, public assistance and welfare, unemployment compensation, government pensions, veterans payments, etc. Nonmoney incomes such as food stamps, surplus food, and rent-free housing are not included. For a more detailed explanation, see Current Population Reports, Series P-60, No. 80.

Poverty index--Families and unrelated individuals are classified as being above or below the low-income level, using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the Department of Agriculture's Economy Food Planand reflects the differing consumption requirements of families based on their size and composition, sex and age of the family head, and farm-nonfarm residence. The low-income cutoffs for farm families have been set at 85 percent of the nonfarm levels. These cutoffs are updated every year to reflect the changes in the Consumer Price Index. The

NOTES--Continued

poverty threshold for a nonfarm family of four was \$4,137 in 1971 \$3,968 in 1970, and \$2,973 in 1959. The low-income (poverty) data exclude inmates of instititions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, See Current Population Reports, Series P-60, No. 81.

Data for standard metropolitan statistical areas (SMSA'S), except where noted, are defined as of 1970. The standard Census definition is used for the four regions within the country. In that definition, the South includes the District of Columbia and the States of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.

The Social and Economic Status of the Black Population, 1971

INTRODUCTION

This is the fifth in a series of statistical reports about the social and economic conditions of the black population in the United States. Included here are the most current data available on selected areas of major interest.

In the 1960's significant advances were made by the black population in many fields--notably, income, health, education, employment, and voter participation. The current statistics indicate continued progress in some areas of life, while other areas remained unchanged. Overall, however, in 1972, blacks still lag behind whites in most social and economic areas, although the differentials have narrowed over the years.

POPULATION AND MIGRATION

The migration of blacks from the South has been an important factor in the redistribution of the black population within the country. In 1970, about 45 percent of the blacks in the West and 34 percent of those in the North were born in the South, reflecting long-term migration patterns. In each of the last three decades, the South lost about 1.5 million blacks through net out-migration. Among the regions, the North received the largest number of migrants, 284,000, from the South during the past 5-year period, 1965 to 1970.

The black population is primarily a metropolitan population, and the majority reside in the central cities. By 1970, about three-fourths of the black population lived in metropolitan areas and about three-fifths in central cities. During the decade of 1960 to 1970, the black population in metropolitan areas increased by 4.0 million.

Natural increase accounted for the greater part of the growth of the black population in metropolitan areas; however, net in-migration, including net immigration from abroad, was also of considerable importance.

INCOME

The median income in 1971 was about \$6,400 for black families and about \$10,670 for white families, providing a black to white median income ratio of 60 percent. In 1971, the relative position of black to white family income was the same as in 1970. However, this 1971 ratio represented a significant improvement over the ratio of 54 percent in 1964, the first date for which corresponding survey data on blacks were available.

There are many factors associated with the black-white income differentials. Some of the statistics relating to these factors are shown in the tables on regional distribution (tables 3 and 19), employment status and duration of employment (tables 35, 36, and 46), occupational structure (tables 50 and 51), education (tables 65 and 66), and family composition (table 78).

The proportion of families of Negro and other races in the \$10,000 and over income category increased during the 1960's. By 1970, approximately 28 percent were at this income level, compared to the 11 percent in 1960, taking into account changes in prices. The proportion with relatively high incomes was still far below that of white families, as about half of the white families had incomes of \$10,000 or more in 1970.

Significant gains in achieving income parity with whites have been made by only a very small segment of black families. These were young husband-wife families residing in the North and West in which both the husband and wife worked. Among these families, the ratio of black to white income was about 104 percent in 1970 compared to 85 percent in 1959. In the South, for the comparable group of black families, the median income was 75 percent of whites, an increase over the 56 percent in 1959. The working wife was an important factor in explaining the narrowing of the income differential between young black and white families. Where only the husband worked, the income differential in the North and West remained at about 75 percent in 1970, whereas in the South, the ratio of 63 percent was up from the 52 percent in 1959.

Among the young husband-wife families, black wives were more likely than white wives to have participated in the employed labor force and as year-round workers in 1970. Nationally, about 68 percent of the young black wives contributed to the family income by working, compared to 56 percent for young white wives. In the North and West, a larger percentage of young black wives worked year round. These black wives earned approximately 30 percent more and also made a larger contribution to the family income than did their white counterparts. For the North and West, the ratio of young wives' earnings to the family income was 35 percent for blacks and 27 percent for whites.

There were 7.4 million blacks below the poverty or low-income level in 1971¹, comprising about 32 percent of the black population in the country. In 1959, the proportion of blacks who were below the low-income level was much higher, 55 percent. From 1959 to 1971, the proportion of whites below the low-income level declined from 18 percent to about 10 percent. Although Negroes made up about 11 percent of all persons, they comprised approximately three-tenths of all people below the low-income level.

¹The low-income threshold for a nonfarm family of four was \$4,137 in 1971, \$3,968 in 1970, and \$2,973 in 1959. (See section on NOTES) The low-income (poverty) data exclude inmates of institutions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age.

Family heads with low educational attainment are more likely to be below the low-income level. This is true regardless of race or sex of head.

The majority of both black and white men who were heads of low-income families worked at some time during 1970. About one-fourth of the men, black and white, who were heads of low-income families had a full-time job the year round.

Black families below the low-income level were more likely than the comparable group of white families to have received public assistance income, but less likely to have received Social Security benefits.

EMPLOYMENT

There were over 9 million persons of Negro and other races in the civilian labor force in 1971, and of that number, over 8 million were employed.

After declining for several years, the jobless rate began to rise in 1970 and continued to rise during 1971. In 1971, the rates averaged 9.9 percent for Negro and other races and 5.4 percent for whites. The ratio of jobless rate for Negro and other races to that of whites was unchanged from the 1970 differential of 1.8:1. During the 1960's this ratio averaged about 2.1:1.

Historically, blacks have been overrepresented in most lower paying, less-skilled jobs and underrepresented in the better paying, high-skilled jobs. This is still true, but the 1970 census data show that blacks made some advances and were more equally represented in the major occupation groups. In 1970, black workers constituted 10 percent of the employed population, but only 5 percent of the professional workers, 3 percent of managers and administrators, and 6 percent of the craftsmen, as contrasted to 17 percent of service workers, about 20 percent of laborers, and about 50 percent of all private household workers. With the exception of the categories service workers and private household workers, these 1970 figures represent an improvement over those for 1960.

The upward movement on the occupational ladder by workers of Negro and other races is exhibited also in the occupational data for the last 11 years. Those employed in the better paying white collar, craftsmen, and operatives occupations increased significantly over the period--from about 3 million in 1960 to about 5 million in 1971. In 1971 Negro and other races constituted about 8 percent of employees in the better paying jobs compared to approximately 6 percent in 1960.

In 1969, there were 163,000 black-owned firms which represented only 2 percent of all enterprises, and which received less than one-half of one percent of the gross receipts. The highest proportion of black-owned firms were in the transportation and other public utilities industries.²

²See U.S. Bureau of the Census, "Minority-Owned Businesses: 1969", MB-1 Table B.

EDUCATION

Since 1965, (the earliest year that survey data on blacks were available) there has been a notable increase in school attendance among young black adults at the college level. In 1971, 18 percent of the young blacks, 18 to 24 years old, were enrolled in college compared to about 10 percent in 1965. There was no significant change in the proportion of whites attending college during this period.

Among family members 18 to 24 years old enrolled in college in 1970, 12 percent of the blacks were from families whose incomes were under \$3,000, as compared with only about 2 percent of the whites in the comparable group.

Gains also have been noted in the proportions of blacks completing high school. By 1971, about three-fifths of young adult black men and women, 25 to 29 years old, completed high school. The high school dropout rate for young blacks, 14 to 19 years old, declined from 14.6 percent in 1970 to 11.1 percent in 1971. Still, the dropout rate for the blacks remained higher than that for the comparable group of whites--7.4 percent in both 1970 and 1971.

In 1970, both black and white men who were school dropouts were more apt than high school graduates to be unemployed or not in the labor force. This situation is more pronounced among blacks. Half of the black men, 16 to 21 years old, who were neither enrolled in school, nor high school graduates, were either unemployed or not in the labor force. About 34 percent of the comparable group of white men were in this category.

In 1970 less than half of the black undergraduate students were enrolled in institutions which were predominantly minority.³ But, in the South, where the majority of the black colleges and students are located, 65 percent of the black undergraduate students still attend institutions which are predominantly black.

HOUSING

Crowding--sometimes measured by the index of "persons per room"--was much greater in Negro occupied housing units than in white occupied housing units. In 1970, 20 percent of black households lived in units with 1.01 or more persons per room compared to 7 percent of white households. Renter-occupied housing was more crowded than owner-occupied units for both black and white households.

The smallest percentage of overcrowding in Negro households--both ownerand renter-occupied--occurred inside central cities of metropolitan areas, in 1970.

³Minority population includes Black, American Indian, Japanese, Chinese, and Spanish American students.

Between 1960 and 1970, the proportion of blacks living in homes they owned increased from 38 percent to 42 percent. In 1970 the rate of owner occupancy was highest for Negro households in the South, 47 percent.

Negro households were less likely to have most major appliances or an automobile available than white households in 1970.

FAMILY COMPOSITION

In 1972, 66 percent of families of Negro and other races were headed by a husband with his wife present. Approximately 88 percent of white families had both spouses present. In 1970, at the upper income level (\$15,000 and over), about 94 percent of black families were headed by a man, about the same proportion as that for white families. At the lower end of the scale, the proportion of black families with incomes under \$3,000 headed by a man was 40 percent compared to 72 percent for whites.

By 1971, about two-thirds of children of Negro and other races were living with both parents, continuing the decline which had occurred between 1960 and 1970. The comparable proportion for white families was 90 percent.

In spite of the sharp decline in both black and white fertility during the 1960's, the total fertility rate of 3.13 children per black woman in 1968 remained substantially higher than that of 2.37 for white women.

Between 1960 and 1971, the average number of children ever born declined markedly among black women, 20 to 24 years old, reflecting the decline in the birth rate during the 1960's.

Though the infant mortality rate for Negro and other races (31.4 per 1,000 live births) was much higher than that for whites (17.4) in 1970, these rates have dropped sharply during the last three decades. In 1968, the maternal mortality rate for mothers of Negro and other races and white mothers was very low--below 1.0 per 1,000 live births.

VOTING

Sharp gains have been made in the number of blacks holding public office since the Civil Rights legislation and the Voting Rights Act of the 1960's. In 1972, of the 2,264 black elected officials, 206 were State legislators, more than double the 94 blacks in these offices in 1964. The increase has been greatest for the South, and consequently, a greater share of all black State legislators are holding office in the South in 1972.

Marked increases also have been noted in the number of black mayors. In 1972, there were 86 mayors compared to 29 in 1968 (the earliest year for which data were available). In 1968, about 58 percent of all black mayors were located in the South; by 1972 the proportion declined to about 51 percent.

Projections of the voting-age population indicate that blacks will represent 14 million, or about 10 percent, of the 139 million persons of voting age in November 1972. In the District of Columbia, almost 70 percent of the voting-age population will be black. Blacks will represent from 22 to 30 percent of the total electorate in five Southern States--South Carolina, Georgia, Alabama, Mississippi, and Louisiana.

SELECTED AREAS

Twenty-six cities in our Nation had a black population of 100,000 or more in 1970. Approximately 4 out of 10 black Americans were living in one of these cities. The blacks in the 26 cities are not homogeneous; rather, their social and economic characteristics vary substantially from city to city. Even within the city, wide disparities can be observed as evidenced by statistics on blacks in selected low-income areas.

Of the cities with 100,000 or more blacks, all except Birmingham, experienced an increase in the black population during the last decade. In eight of the cities, net in-migration contributed to half of the growth. Of the 26 cities, three (Washington, D.C., Newark, N.J., and Atlanta, Ga.) had a black majority, and six had a black population between 40 and 50 percent of the total population.

In all of the cities except Memphis, one-fourth or more of the black adult population were high school graduates. Los Angeles had the highest proportion of high school graduates--50 percent of the black adult population; Washington, D.C. and Atlanta, Ga. had the highest proportion of college graduates--8 and 7 percents, respectively. Nearly all, 93 percent, of the public elementary school children in the District of Columbia were black. In 13 of the remaining 25 cities, black children represented a majority of those attending public elementary school.

Washington, D.C. led in the proportion of black workers engaged in the professional, technical, and managerial occupations--15 percent--followed closely by Los Angeles. In all the cities the proportion of black workers employed as craftsmen or foremen ranged from about 6 to 10 percent. Black persons were notably underrepresented in the area of self-employment.

Four out of every 10 black families in Washington, D.C. and Detroit received incomes of \$10,000 and over in 1969. These were the cities where black families, as well as black persons had the highest incomes in 1969.

In 1969, four out of every 10 black persons in New Orleans, Memphis, Birmingham, and Jacksonville were below the low-income level. This proportion was above the low-income rate of 31 percent for all black urban persons.

Blacks represented over half of the voting-age population in only one of the 26 cities, Washington, almost half in Newark and Atlanta, and from about 30 to approximately 40 percent in nine other cities.

About 4.3 million blacks 16 years old and over were living in selected low-income areas of 51 urban places⁴ at the time of the Census Employment Survey (August 1970 through March 1971). There were 1.6 million black families in these selected areas. These families comprised about 40 percent of all black urban families in 1970. In the selected low-income areas approximately 438,000 black families were poor. These families represented about 42 percent of all poor black urban families.

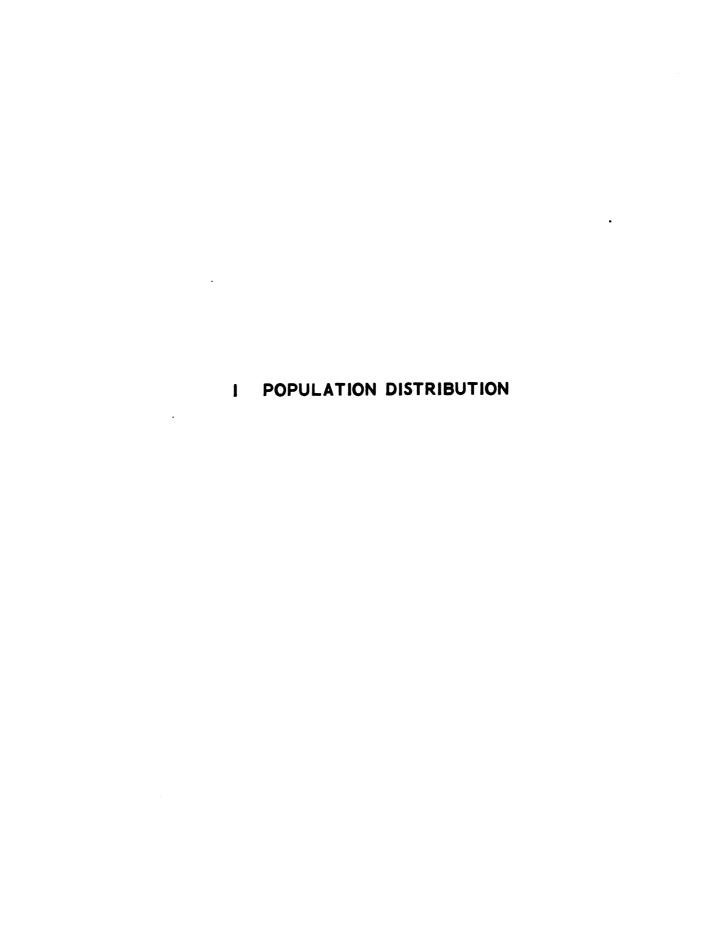

The majority of black families living in selected low-income areas were headed by a man--63 percent. Of the remaining 37 percent headed by a woman, the median income was \$3,900, about half the \$7,800 for those families headed by a man.

Unemployment, and especially long-term unemployment, was more prevalent in the selected low-income areas than in the country as a whole. At the time of the Census Employment Survey, 284,000 black persons, or 11.1 percent of the labor force, were unemployed in the selected low-income areas. Most of the unemployed were seeking full-time work. About half of those 16 to 64 years old seeking work, indicated that they had a problem in finding a job. The most frequent reasons cited were lack of skill, experience, or education.

In addition to those unemployed, about 932,000 black persons 16 to 64 years old in the selected low income areas indicated that they desired work, but were unable to seek it. They cited either family responsibilities or illness and disability as the major reason for not actively seeking employment.

Changes in these and other measurable aspects of the living conditions of blacks in the United States are indicated in the tables of this report.

⁴Low-income areas were identified on the basis of several criteria--census tracts with a high proportion of families with "low income" in 1960, and other more recent socio-economic data along with views of local knowledgeable agencies. For a detailed explanation, see 1970 Census of Population and Housing, Employment Profiles of Selected Low-Income Areas, Series PHC(3).

CONTENTS

14.	Population by Age and Sex: 1971	24
15.	Negro Population by Region and Age: 1960 and 1970	25

The percent of blacks in the total population has increased since 1940 (9.8 in 1940 to 11.2 in 1971). This increase can be attributed to higher birth rates resulting in a greater rate of population growth for blacks than for the rest of the population during this period.

Table 1. Total and Negro Population: 1900, 1940, 1950, 1960, and 1966 to 1971

(Numbers in millions)

Year	Total	Negro	Percent Negro
19001	76.0	8.8	12
19401	131.7	12.9	10
1950 ¹	150.7	15.0	10
1960	179.3	18.9	11
1966	195.0	21.2	11
1967	197.0	21.6	11
1968	198.9	21.9	11
1969	200.9	22.2	11
1970	203.2	22.6	11
1971	205.7	23.0	11

Note: Data are as of April 1 for each year.

Data exclude Armed Forces overseas.

¹Data exclude Alaska and Hawaii.

The Negro population grew at a faster rate than the white population during the 1960-70 decade. The rate for Negroes was 20 percent; for whites 12 percent. Higher birth rates for Negroes were a major contributor to their faster rate of growth.

Table 2. Components of Change for Resident Population: 1960 to 1970

(Numbers in thousands)

¹Base is population at beginning of period.

²Consists of net civilian immigration, net movement of the Armed Forces to posts overseas, and error of closure.

Between 1950 and 1970, the proportion of Negroes living in the South declined, while the percent of whites living in that region remained virtually unchanged. More than half (53 percent) of Negroes still live in the South.

Table 3. Percent Distribution of the Population by Region: 1950, 1960, and 1970

Subject	1950 ¹	1960	1970

West	14	16	18

¹Data exclude Alaska and Hawaii.

Between 1950 and 1970, the migration of the Negro population from the South to other regions has been the main reason for the decline in the proportion of the population which is Negro in the South, and to the corresponding rising trend noted in the North and West.

The South continues, however, to be the area with the largest proportion of Negroes.

Table 4. Negroes as a Percent of the Total Population in the United States and Each Region: 1950, 1960, and 1970

Area	1950¹	1960	1970
United States	10	11	11
South North Northeast North Central	22 5 5 5 3	21 7 7 7 4	19 8 9 8 5

¹Data exclude Alaska and Hawaii.

During the last decade, Negroes continued to leave the South in about the same numbers as in the preceding two decades. Although the South lost about 1,500,000 Negroes in each of three decades through net out-migration, high birth rates and drop in mortality rates resulted in a continuing increase in the number of Negroes residing in the South.

Table 5. Negro Population and Estimated Net Outmigration of Negroes From the South: 1940 to 1970

(Numbers in thousands)

Subject	1940	19	950	196	0	1970

	1940-	50	19	50-60	1	1960-70
Average annual net outmigration of the Negro population from the South	15	9.9		147.3		147.4

About 310,000 blacks, 5 years old and over, have moved to the North since 1965, and nearly all, 92 percent, of them were residents of the South in 1965.

The West received 150,000 blacks from the other two regions between April 1965 and April 1970. About 94,000 were from the South.

The number of black migrants who moved to the North and West during the period 1965 to 1970 was similar to the earlier period, 1955 to 1960. On the other hand, the South received more interregional black migrants during the period 1965 to 1970.

 $^{^{1}}$ Includes population abroad in 1965 or 1955 but excludes residence not reported for those years.

²Data are for Negro and other races.

Source: U.S. Department of Commerce, Social and Economic Statistics Admininstration, Bureau of the Census.

The overwhelming majority of blacks in this country were born in the South. In 1970, 70 percent of the 20.5 million native black persons were born in the South, a decline from the 79 percent in 1960.

The mass migration since 1940 of the Southern born blacks to the North and West is very evident in the figures on region of birth. In 1970, about 45 percent of the blacks in the West and 34 percent of those in the North could be classified as "life-time migrants" from the South. These 1970 figures were substantially lower than the corresponding figures for 1960. Nearly all of the blacks in the South were born in that region.

The population increase among Negroes since 1960 has been almost all in the central cities—an increase of 3.3 million. In contrast, the population increase in the white population occurred mainly in the suburbs (outside central cities). Although there was a continued exodus of the white population from central cities during the decade, the number of whites in the central cities in 1970 remained about the same as in 1960. Only a slight increase in the number of Negroes in the suburbs (outside central cities) took place in this decade, however, the rate of increase was substantial.

¹Includes Somerset and Middlesex Counties in New Jersey which are not part of any standard metropolitan statistical area (SMSA), but are in the New York, N.Y.-Northeastern New Jersey Standard Consolidated Area.

Between 1960 and 1970, the population of Negro and other races in metropolitan areas increased by over 5 million. Although a greater proportion of the growth can be attributed to natural increase (3.0 of the 5.1 million), net in-migration, including net immigration from abroad, accounted for a substantial part (2.1 of the 5.1 million).

The population of Negro and other races outside metropolitan areas hardly changed over the decade with natural increase being offset by net outmigration.

The growth in the white population in metropolitan areas was due, overwhelmingly, to excess of births over deaths.

Note: Metropolitan areas include State economic areas in place of SMSA's in New England, and Somerset and Middlesex Counties in New Jersey.

¹Base is population at beginning of period.

²Includes net immigration from abroad.

In each region, except the South, blacks are concentrated in the central cities. About four-fifths of the blacks in the North and two-thirds of those in the West reside in central cities. Less than half, about 41 percent, of the blacks in the South were in central cities. However, the proportion of blacks in central cities of the South has increased since 1960.

Table 10. Percent Distribution of the Negro Population, Inside and Outside Metropolitan Areas, for Regions: 1960 and 1970

¹Includes Middlesex and Somerset Counties in New Jersey.

Among the metropolitan areas, the population of Negro and other races showed the greatest numerical growth in the Northeast (1.5 million or 51 percent) and the largest percentage increase in the West (1.1 million or 63 percent). In both of these areas, net in-migration, including net immigration from abroad, accounted for over half of the increase in the 1960 to 1970 period.

On the other hand, in the South natural increase accounted for nearly all, 90 percent, of the change in the metropolitan population of Negro and other races.

³SEA'S are used for New England metropolitan areas in place of SMSA'S. Includes Middlesex and Somerset Counties in New Jersey.

In all regions, blacks comprised a greater proportion of the central city population in 1970 than in 1960. The changes were most noticeable in the Northeast and North Central areas, where blacks now represent one-fifth of the central city population. The central cities in the South, which registered a modest increase, have the highest proportion of blacks--28 percent.

Outside the South, the percentages of blacks in the suburbs (outside central cities) remained approximately the same, at less than 5 percent. For the South, the proportion of blacks in the suburbs declined from 13 to 10 percent.

Table 12. Negroes as a Percent of Total Population, Inside and Outside Metropolitan Areas, for Regions: 1960 and 1970

		M	letropolitan ¹

West: 1960	4 5	5 6	8 10	2 3	1	

¹Includes Middlesex and Somerset Counties in New Jersey.

The larger the metropolitan area, the greater the proportion of Negroes in the central cities and the greater the change in the percent Negro since 1960.

Negroes today are 28 percent of the total population of central cities in the very largest metropolitan areas (2 million or more population), compared with only 20 percent in 1960. The corresponding figures for cities of metropolitan areas of 500,000 to 999,999 are 19 percent in 1970 and 16 percent in 1960. The proportion Negro in the smaller metropolitan areas (under 500,000) has shown only a slight increase since 1960.

Since the rate of growth of Negroes and whites in the suburbs was about the same during the decade, the proportion of Negroes in the suburbs in 1970 remained at the 1960 level of 5 percent.

The Negro population is considerably younger than the white population. In 1971, the median ages of Negro males and females were 21.1 and 23.6 respectively, and for white males and females, 27.7 and 30.4, respectively.

A greater concentration of the Negro population was in the preschool and elementary school age group, 14 years and under-about 35 percent. Among whites, the proportion in this age category was about 27 percent.

Since the mid 1960's, substantial gains have been made in narrowing the gap between the median income of Negro and white families. In 1971, the ratio of Negro to white family income was 60 percent, a noticeable increase over the 1964 ratio of 54 percent. No significant narrowing of the income differential was observed between families of Negro and other races and white families during the 13-year period preceding 1964.

Between 1970 and 1971, there was no significant change in the income ratio of Negro to white families.

Note: Most of the tables in this section show income data for the year 1970. Income figures for 1971 from the Current Population Survey conducted in March 1972, which recently became available, have been included in tables 16 and 19 in this section. Median family income in 1971 of Negro families was \$6,440, not significantly different from the median of \$6,279 in 1970.

NA Not available. The ratio of Negro to white median family income first became available from this survey in 1964. Figures for 1959 are from the 1960 Census 1-in-1,000 sample.

¹The 1971 income data from the March 1972 Current Population Survey are tied in with figures using 1970 census-based population controls. For a more complete explanation of changes, see "Revisions in Current Population Survey," Employment and Earnings, Vol. 18, No. 8 and forthcoming Current Population Reports, Series P-60 report on 1971 Income.

Over the past 23 years, the median incomes of families of Negro and other races have increased proportionately more than those of whites. The median income of Negro and other races increased by 132 percent compared with 87 percent for white families. With the rising median incomes for Negro and other races, there has been a shift in the income distribution as exhibited by the substantial reduction in the proportion of families of Negro and other races with incomes under \$3,000 and the corresponding increase in the percent with incomes \$10,000 and over. In 1970, about one-fifth of the families were in the under \$3,000 class, compared to 54 percent in 1947.

The dollar gap (adjusted for price changes) between Negro and other races and white families has widened--from \$2,700 in 1947 to \$3,700 in 1970.

X Not applicable.

The proportion of families of Negro and other races in the \$10,000 and over income class has steadily increased since the early 1960's. In 1970, approximately 28 percent were at this income level, which was substantially greater than the 11 percent in 1960. About half of the white families had incomes of \$10,000 or more in 1970.

In the North and West, about 38 percent of the families of Negro and other races were in the \$10,000 and over income group in 1970. The comparable figure was about 18 percent for the South.

Table 18. Percent of Families With Income of \$10,000 or More, 1947 to 1970, and by Regions: 1966 to 1970

(Adjusted for price changes, in 1970 dollars. A \$10,000 income in 1970 was equivalent in purchasing power to about \$5,800 in 1947)

In both 1959 and 1971, the median income of Negro families was closer to that of white families in the North and West than was the case in the South. The ratio of Negro to white family income in 1971, was about 69 percent in the North and West, and 56 percent in the South.

Although the ratio of Negro to white income was lower in the South than in the North and West in 1959 and 1971, the ratio in the South had increased since 1959. On the other hand, there was no significant change in the ratio for the North and West during the same period.

Table 19. Families by Median Income in 1971, and Negro Family Income as a Percent of White, by Region: 1959, 1966, 1970, and 1971

In 1970, the relative disparity in incomes between black and white families was smaller for husband-wife families than for other types of families (most of which were headed by a woman). The same pattern was observed in the North and West, where the ratio of Negro to white income for husband-wife families was about 88 percent in 1970. There was no apparent difference in 1970 between the incomes of black and white husband-wife families outside the South where the head was under 35 years old. In these young families, the ratio of black to white median income was approximately 96 percent in 1970, a significant increase over the 78 percent in 1959. However, these young black families in the North and West, whose incomes were about equal to those of whites, comprised a relatively small proportion, 10 percent, of the 4.9 million black families in the country in March 1971.

An important part of the explanation of the narrowing gap between black and white family incomes is the working wife. The income parity observed for young black and white families in the North and West holds true only for families in which both the husband and wife worked. For these families, the ratio of black to white income was about 104 percent in 1970; the comparable figure was 85 percent in 1959. In contrast, no gains were made in closing the income gap by young black families in which only the husband worked in the North and West. In both 1970 and 1959, these black young families were making only about three-fourths as much money as comparable white families in the North and West.

¹Includes other combinations not shown separately.

In 1970 and 1959, Negro wives were more likely than white wives to have worked. In the North and West, the number of young Negro families in which both the husband and wife worked has increased by about 95 percent since 1959. By 1970, about 63 percent of young Negro wives in this area contributed to the family income by working, as contrasted to 54 percent for the young white wives.

In 1970, a higher proportion of these young working Negro wives than the comparable group of white wives held a job the year round. Of those working, approximately 52 percent of the Negro wives worked all year compared to only about 36 percent of the white wives.

For the United States as a whole, Negro wives earned less on the average than white wives in 1970 (\$3,300 and \$3,500, respectively), but their earnings accounted for a greater share of the family income (31 percent and 26 percent, respectively). In contrast, young Negro wives in the North and West were earning approximately 30 percent more than did their white counterparts as well as making a larger contribution to the family income. The ratio of young wives' earnings to the family income was 35 percent for Negroes and 27 percent for whites. In 1959, although young white and Negro wives earned about the same, there is some evidence that Negro wives contributed more to their family income than did white wives.

While Negro wives, overall, earned 95 percent as much as did white wives, the comparable ratio for husbands was only 71 percent. For those young Negro families in the North and West whose family incomes reached parity with whites and whose wives earned more than did comparable white wives, Negro husbands' earnings averaged 90 percent of the comparable white husbands' earnings. This represents a major improvement since 1959 when the ratio was 76 percent.

Regardless of race, men have higher incomes than women. However, the disparity in income between men and women tended to be less among blacks than among whites. Among year-round full-time workers, the income of black women averaged about 70 percent that of the black men, while that of white women was about 59 percent of the white men.

²Refers to total with income.

While the proportion of both Negroes and whites below the low-income level decreased between 1959 and 1971, the decline was greater for whites than for Negroes. In 1971, approximately 10 percent of white persons and about 32 percent of Negro persons were below the low-income level. The comparable figures in 1959 were 18 and 55 percents, respectively. Since 1959, the number of whites below the low-income level dropped by about 37 percent as compared with a 25 percent reduction in the number of Negroes.

Between 1970 and 1971, the number of low-income persons did not change. The apparent change between 1970 and 1971 in the number of low-income black persons (from 7.5 to 7.4 million) and the number of white persons below the low-income level (from 17.5 to 17.8 million) was not statistically significant.

Table 25. Persons Below the Low-Income Level: 1959 to 1971

Note: Most of the tables on the low-income population in this section show data for the year 1970. Figures for 1971 from the Current Population Survey conducted in March 1972, which recently became available, have been included in Tables 25-28 of this section.

The poverty threshold for a nonfarm family of four was \$4,137 in 1971, \$3,968 in 1970, and \$2,973 in 1959. Families and unrelated individuals are classified as being above or below the poverty threshold (low-income level), using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the Department of Agriculture's Economy Food Plan and reflects the differing consumption requirements of families based on their size and composition, sex and age of the family head, and farm-nonfarm residence. The low-income cutoffs for farm families have been set at 85 percent of the nonfarm levels. These cutoffs are updated every year to reflect the changes in the Consumer Price Index. The low-income (poverty) data exclude inmates of institutions members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, see Current Population Reports, Series P-60, No. 81.

NA Not available. Revised using 1970 Census-based Population controls.

¹Beginning with the March 1967 Current Population Survey, data are based on revised methodology for processing income data.

²The low-income data for 1971 and 1970 (r) are tied in with figures using 1970 census-based population controls and are, therefore, not strictly comparable to the data for earlier years which are based on 1960 census population controls. For a more detailed explanation, see "Revisions in Current Population Survey," Employment and Earnings, Vol. 18, No. 8 and forthcoming Current Population Reports, Series P-60 report on 1971 Low-Income.

^{&#}x27; Source: U.S. Department of Commerce, Social and Economic Statistics Administration, Bureau of the Census.

About 1.5 million Negro families and 3.8 million white families were below the low-income level in 1971--about 29 percent of all Negro families and 8 percent of all white families. For low-income families headed by a man, there was no statistically significant difference in the decline since 1959 of 49 percent for whites and 54 percent for Negroes. In contrast, the number of low-income white and Negro families headed by women increased between 1959 and 1971. In 1971, about 54 percent of Negro families and 27 percent of white families with a female head were below the low-income level.

There was no change between 1970 and 1971 in the number of white and Negro families below the low-income level.

Revised using 1970 Census-based population controls.

¹The low-income data for 1971 and 1970(r) are tied in with figures using 1970 census-based population controls and are, therefore, not strictly comparable to the data for earlier years which are based on 1960 census population controls. For a more detailed explanation, see "Revisions in Current Population Survey," Employment and Earnings, Vol. 18, No. 8 and forthcoming Current Population Report, Series P-60 report on 1971 Low-Income.

Negroes comprised about three-tenths of the population below the low-income level in 1971. About one-half of all black persons in 1971 were children under 18 years old. They represented about 37 percent of all low-income children. Aged family heads and unrelated individuals accounted for about 17 percent of whites below the low-income level, whereas the comparable proportion for Negroes was about 7 percent.

Between 1959 and 1971, the proportion of persons below the low-income level who were living alone or with nonrelatives increased for both whites and Negroes. In 1971, about 12 percent of Negroes and 24 percent of whites below the low-income level were unrelated individuals. The comparable figures in 1959 were 8 percent and 18 percent, respectively.

Since 1959, the number of persons with income slightly above the low-income level has decreased by three-tenths--from 15.5 million in 1959 to 10.9 million in 1971. Between 1959 and 1971, white persons with incomes between 100 and 125 percent of the low-income level declined by 37 percent, while those of Negro and other races increased by 20 percent. Accordingly, Negro and other races as a percent of all persons with incomes slightly above the low-income level increased from 14 percent in 1959 to 23 percent in 1971. The proportion of all children in families with incomes between 100 and 125 percent who were Negro and other races increased greatly, from about 14 percent in 1959 to 27 percent in 1971.

Note: The average threshold for a nonfarm family of four below 125 percent of the low-income level was \$5,171 in 1971, \$4,146 in 1966, and \$3,716 in 1959. See "note" on table 25 for definition of low-income level.

⁽X) Not applicable.

In 1970 a greater proportion of low-income black families than of all black families were living in the South. About two-thirds of the low-income families resided in the South, but only about half of all black families lived in that region.

In the South, approximately 6 out of every 10 low-income families were living outside metropolitan areas while in the North and West, the overwhelming majority, 9 out of every 10 poor black families, were residents of metropolitan areas.

About 23 percent of all black families in metropolitan areas were below the low-income level in 1970. This rate did not vary significantly by region from the national figure. The low-income rate in the nonmetropolitan areas of the South was 50 percent as compared to 17 percent in the North and West.

Family heads with low educational attainment are more likely to be below the low-income level. This is true regardless of race or sex of head. About one-third of the black male heads and one-fifth of the white male heads with less than 8 years of schooling were below the low-income level in 1970, as compared to about 2 percent for male family heads with 4 years of college or more. The low-income rates for female family heads showed the same type of relationship, but were substantially higher than those for male heads.

The average number of persons per family was larger for black than for white families both above and below the low-income level. Negro families in metropolitan areas were smaller than those outside metropolitan areas, while the size of the average white family did not vary by residence.

Per capita income data permit a relationship to be shown between the incomes of Negroes and whites by roughly reducing the effect of differences in average family size for these groups. In 1970, the average income per family member for black families was lower than that for white families both above and below the low-income level. For low-income families, the average income per family member was \$540 for Negroes, \$40 below the \$580 for whites. The corresponding figures for families above the low-income level were \$2,330 and \$3,500, respectively, a difference of \$1,170. The ratio of Negro to white income per family member was much higher for those families below the low-income level--93 percent, compared to 67 percent for families above the low-income level. The income per family member for Negroes came closer to that of whites in metropolitan areas than in nonmetropolitan areas.

About 55 percent of black men and 30 percent of black women, who were heads of low-income families, were employed in 1971. These proportions were not statistically different from the comparable percents for white men and women who were heads of families.

The majority of both black and white men who were heads of low-income families worked at some time during 1970. However, the proportion (67 percent) of black male heads who worked was higher than that for the comparable group of whites (61 percent). For both blacks and whites, year-round full-time workers represented about one-fourth of the low-income male family heads.

In, March 1971, about 25 percent of all persons of Negro and other races and 4 percent of all whites received public assistance or welfare income.

The proportion of all persons of Negro and other races receiving Social Security payments (11 percent) was slightly less than that for whites--13 percent.

Table 33. Persons Receiving Public Assistance and Social Security Income in March 1971

In 1970, about one-half of the low-income Negro families and one-third of the Negro unrelated individuals below the low-income level received public assistance income. The comparable figures for whites were 23 percent and 15 percent, respectively.

In contrast, a greater proportion of low-income whites than Negroes received income from Social Security. About one-third of the white families below the low-income level in 1970 received Social Security benefits as compared to approximately one-fourth for Negro families. Of the 4 million white unrelated individuals below the low-income level, over one-half received Social Security payments. The comparable figure for Negroes was 35 percent.

Regardless of race, a higher proportion of low-income families headed by women than headed by men received income from public assistance. Among the low-income families headed by women, about six out of every ten Negro families and about four out of every ten white families received income from this source.

In 1971 the number of unemployed persons of Negro and other races rose to .9 million. White unemployment also increased in 1971 to 4.1 million, surpassing the peak year (1961) of the last decade. Proportionately, the increase between 1970 and 1971 in the number of unemployed persons of Negro and other races was not statistically different from that for whites.

1971	8.4	70.7	0.9	4.1	

Note: The information on employment and unemployment is obtained from a monthly sample survey of households. All persons 16 years of age and over are classified as employed, unemployed, or not in the labor force for the calendar week containing the 12th of the month. The unemployed are persons who did not work or have a job during the survey week, and who had looked for work within the past 4 weeks, and were currently available for work. Also included are those waiting to be called back to a job from which they had been laid off or waiting to report to a new job. The sum of the employed and the unemployed constitutes the civilian labor force.

The unemployment rate for both Negro and other races and for whites declined continually in the 1960's after a sharp rise during the 1961 recession. The jobless rate began to rise in 1970 and continued in 1971. The overall jobless rate of persons of Negro and other races averaged 9.9 in 1971, approximating the 1964 rate, whereas that for whites reached 5.4 percent, the highest level since 1961.

Proportionately, the increase from 1970 to 1971 in unemployment rates for Negro and other races was not statistically different from that for whites. Thus, the ratio of the jobless rate for Negro and other races to that for whites was unchanged from a 1970 differential of 1.8:1. During the 1960"s, this ratio averaged 2.1:1.

Table 36. Unemployment Rates: 1948 to 1971

(Annual averages)

Year	Negro and other races	White	Ratio: Negro and other races to white

1970	8.2	4.5	1.8
1971	9.9	5.4	1.8

Note: The unemployment rate is the percent unemployed in the civilian labor force.

Unemployment rates for teenagers were substantially higher than those for adults from 1960 through 1970. In 1971, this pattern continued. The rate in 1971 was highest for teenagers of Negro and other races, 31.7 percent, which was about double that for white teenagers, 15.1 percent.

Unemployment rates for adult men and women of both races were up substantially from the 1970 levels.

Table 37. Unemployment Rates by Sex and Age: 1960 and 1969 to 1971

[&]quot;Teenagers" include persons 16 to 19 years old.

As with the overall unemployment rates, the rates for married men of Negro and other races and married white men rose substantially between 1970 and 1971, after a declining trend from 1962 to 1969. The ratio of the unemployment rate for married men of Negro and other races to that for white married men remained at the 1970 differential of 1.6 to 1.

In 1971, the jobless rate for married men of Negro and other races, 4.9 percent, was still below the 1962 level. For white married men, the 1971 rate was about the same as the 1962 rate.

Table 38. Unemployment Rates for Married Men, 20 Years Old and Over, With Spouse Present: 1962 to 1971

1971	4.9	3.0	1.6	

In October 1971, approximately 24 percent of the 1.3 million black teenagers enrolled in school were in the labor force--14 percent were holding a job, and about 9 percent were seeking employment. Of those not enrolled in school, 18 percent were jobless, and the overwhelming majority of these unemployed black teenagers were looking for full-time work. Approximately 38 percent of the teenagers out of school were not in the labor force.

In 1971, the unemployment rate for men of Negro and other races 20 to 29 years old was 12.9 percent. The unemployment rate for Vietnam era veterans of Negro and other races appears to be higher than that for nonveterans, however, standard errors on the small number of sample cases are such that there is no statistically significant difference. Among whites, the unemployment rate in 1971 for the white Vietnam era veteran was higher than that for the nonveteran --8.3 percent for veterans compared to 6.6 percent for nonveterans.

Workers of Negro and other races are more likely than white workers to experience long periods of joblessness. In 1971, 2.4 percent of the labor force of Negro and other races, compared to 1.3 percent of the white labor force, had been jobless for 15 or more weeks. For each of these population groups, long-term unemployment represented about 24 percent of the total unemployment in 1971.

¹Unemployed for at least 3-1/2 consecutive months, 15 weeks or more.

Loss of job as a result of layoff or discharge by employer was still the major reason for unemployment in 1971 for white women and men, and for men of Negro and other races. The largest proportions of unemployed women of Negro and other races had either lost their last job or were returning to the labor force.

¹Unemployment rates are calculated as a percent of the civilian labor force.

The jobless rate for Negro and other races in the experienced labor force increased from 8.3 percent in 1970 to 10.0 percent in 1971. Among the workers, a rise in the unemployment rate was noted for Negro and other races in the professional, technical, craftsmen, operatives, and service occupations.

In both 1970 and 1971, Negro and other races employed in professional, technical, and managerial occupations had the lowest jobless rates. Men of Negro and other races experienced the highest unemployment rates in nonfarm labor occupations.

Teenagers in the central cities experienced high unemployment rates. Among all metropolitan areas, the unemployment rate in 1971 for teenagers of Negro and other races was higher in the central cities (36 percent) than in the suburbs (29 percent). The jobless rate for adults living in the central cities was not statistically different from that in the suburbs.

In the 20 largest metropolitan areas, the unemployment rate for men of Negro and other races in the central cities was similar to that in the suburbs.

¹Metropolitan areas as defined in 1960.

²Includes persons 16 to 19 years old.

In the age groups 25 to 64 years, men of Negro and other races were less likely than white men to be in the labor force. On the other hand, for these same age groups, the labor force participation of women of Negro and other races was higher than that of white women.

For both teenage boys and girls, the labor force participation rates were lower for Negro and other races; for both women and men 20 to 24 years old the rates for Negro and other races and whites were about the same.

Table 45. Labor Force Participation Rates by Age and Sex: 1971

(Includes Armed Forces. Annual averages)

65 years and over	25	26	12	9	

The proportion of men of Negro and other races in the labor force working year round, full time in 1970 was somewhat less than for white men. About three-fifths of men of Negro and other races, compared with two-thirds of white men, worked year round, full time.

About the same proportion of women of Negro and other races and white women worked year round, full time.

Table 46. Persons Who Worked During 1970, by Full- and Part-Time Job Status

In the age groups 25 to 64 years, a larger proportion of men of Negro and other races than white men were not working because they were physically and mentally unable to work. For both groups (Negro and other races and whites) similar proportions (about 8 out of 10) of the teenagers not in the labor force were attending school.

⁻ Represents zero or rounds to zero.

¹Includes only those who have serious, long-term physical or mental illness.

²Includes retired workers and unpaid family workers working less than 15 hours per week, and those awaiting military service.

About half of both Negro and white women who were heads of families were in the civilian labor force in March 1971. About 10 percent of Negro women who were heads of families and in the labor force were unemployed. The jobless rate for the comparable group of white women was 6 percent.

During the last 11 years, the number of workers of Negro and other races employed in the better paying white-collar, craftsmen, and operatives occupations increased by 69 percent--from about 3 million in 1960 to about 5 million in 1971. For the white population employed in these jobs, the percentage increase was less, 23 percent between 1960 and 1971.

In 1971, Negro and other races constituted about 8 percent of employees in the higher skilled, better paying jobs compared to about 6 percent in 1960.

Note: Comparisons with data prior to January 1971 are affected by the reclassification of census occupations that was introduced in that month. For an explanation of the changes see Bureau of Census Technical Paper No. 26, "1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements."

¹Includes private household and other service workers, laborers and farm workers. Median usual weekly earnings were about \$40 to \$120 a week for these workers, compared with \$120 to about \$200 a week for white-collar workers, craftsmen, and operatives in May 1971.

Despite the upgrading of employment for Negro and other races, marked differences still existed between Negro and other races and whites in the distribution of employment in 1971. About 13 percent of all employed workers of Negro and other races held professional, technical, and managerial positions compared with 27 percent for whites. Similarly, among craftsmen and foremen, the proportions were 8 percent for Negro and other races and 13 percent for whites. About 41 percent of employed persons of Negro and other races were engaged in service, private household, farm and laboring jobs, about double the 20 percent for whites.

Table 50. Employed Persons by Occupation: 1971

Historically, blacks have been overrepresented in most lower paying, less-skilled jobs and underrepresented in the better paying, high-skilled jobs. While this is still true, the 1970 census data show that blacks made some advances and are becoming more equally represented in the major occupation groups. In 1970, black workers constituted 10 percent of the employed population, but only 5 percent of the professional workers, 3 percent of managers and administrators, and 6 percent of the craftsmen, as contrasted to 17 percent of service workers (excluding private household), about 20 percent of laborers, and about 50 percent of all private household workers. With the exception of the categories service workers and private household workers, these 1970 figures represent an improvement over corresponding 1960 percentages.

Private household workers	1,152	610	53

The proportion of black workers of the total employment in the 9 industries with relatively high hourly earnings ranged from 6 to 13 percent in 1970. In spite of this, blacks held no more than 2 percent of the higher paying jobs (professional, technical, or managerial) in any of the 9 industries. In all of the 9 industries, blacks were overrepresented in the lower paying jobs, but their share of the middle level jobs was more comparable to the proportion that blacks are of all employees.

¹Professional, managerial and sales workers.

²Technical, clerical, craftsmen, operatives, and labor workers.

³Service workers.

⁴Data from Bureau of Labor Statistics Monthly Report on Employment, Payroll and Hours, 1970.

⁵Nine high earnings industries.

⁶Average hourly earnings includes "all transportation and public utilities."

In each of the 9 industries with high hourly earnings, the proportion of blacks in the highest paid jobs as professional, technical, and managerial workers was far below the comparable proportion of all workers.

A higher proportion of blacks than of all workers held middle pay level jobs in all of the industries. In all of the industries, smaller percentages of the black employment were in the craftsmen jobs, the relatively well-paid middle level jobs.

¹Professional, managerial and sales workers.

²Technical, clerical, craftsmen, operatives and labor workers.

³Service workers.

⁴Nine high earnings industries.

In the 9 industries with the largest proportion of black workers, blacks held 18 percent of all jobs, but only 5 percent of the higher paid occupations (professional, technical, and managerial) in 1970. Blacks were employed in 12 percent of the craftsmen jobs, which tend to be well paying, 18 percent of the other middle level jobs, and 27 percent of the lower paying jobs.

The proportion of black workers in the higher and middle level jobs was greater in the 9 industries than in all industries.

²Technical, craftsmen, operatives, and labor workers.

³Service workers.

⁴Nine industries with a large proportion of Negroes.

In higher paying jobs, the local passenger transit industry had the largest percentage (11) of black employees. The proportion of black workers in these jobs was 8 percent for medical and other health services, and 6 percent for eating and drinking places. For the remaining 6 industries, the percentage of blacks in these jobs was strikingly low-4 percent or less.

Blacks in the 9 selected industries are more likely than blacks in all industries to be in the lower paid occupations.

⁴Nine industries with a large proportion of Negroes.

Black employees held 15.1 percent of all full-time Federal jobs in May 1971, compared with 13.5 percent in June 1965. In 1971, blacks represented 11 percent of all Federal employees paid under the Federal Classification Act; 21 percent under Wage System; 18 percent under Postal Field Service rates; and 6 percent under all other pay systems.

Blacks held about 3 percent of the GS-12 to 15 jobs and 2 percent of those in the highest grades (GS-16 to 18) under the Federal Classification Act.

Note: Classification Act (General Schedule and Similar) salary schedules are based on 1971 pay rates which start at \$4,326 a year for a GS-1 employee and increase for each grade to \$37,624 for GS-18 at the entering level. Pay rates by grade for Regular Nonsupervisory, Regular Leader, and Regular Supervisory are not standard nation-wide. For example, the WG-1 salary varies by geographic areas, because in each wage area, the rates are determined by the prevailing rate in the private sector. Postal Field Service pay rates range from \$5,178 a year for a Grade 1 employee to \$33,171 for a Grade 21, at the entering level. In 1965 there were 20 PFS grades.

¹Includes other pay plans, not shown separately.

² In 1970-71 the majority of Federal employees under wage systems were converted to one of the Coordinated Federal Wage Systems (CFWS)--Regular Nonsupervisory, Regular Leader, and Regular Supervisory. The remaining employees were in "other wage systems," which will eventually be converted to the CFWS.

³ Includes 4th class postmasters and rural carriers.

Nearly all, 91 percent, of the black firms operated as sole proprietor-ships. Only a minority, about one-fourth, of the 163,000 black-owned firms had paid employees; however, they accounted for the major portion, 82 percent, of the gross receipts of black-owned businesses in 1969.

Over 50 percent of black-owned businesses were located in the South with less than half as many accounted for in the North Central Region, the second region of concentration.

¹Includes firms not specified by region.

Black-owned firms represented 2 percent of all enterprises in 1969. Among the specified industries, transportation and other public utilities had the highest proportion of black-owned firms.

Black-owned businesses received less than one-half of a percent of the total gross receipts. In only one industry group, selected services, was the proportion of gross receipts received by black-owned firms above 1 percent.

Automotive dealers and gasoline filling stations ranked first in gross receipts among black-owned firms, despite the fact that they accounted for only a small proportion of black-owned enterprises in 1969. Although black-owned businesses were concentrated in personal services industries, these businesses received only 9 percent of the gross receipts of the 10 most important industry groups (ranked in terms of gross receipts).

70.	Black Undergraduate Students Enrolled in College, by Type and Region of Institution: 1970	88

Since 1965 (earliest year that survey data on blacks were available), there has been a marked improvement in the proportion of young adult blacks enrolled in school. In 1971, 18 percent of the blacks 20 to 24 years old were attending school, a substantial increase over the 9 percent in 1965. Among whites 20 to 24 years old, there has been little change in proportions attending school over the past 6 years.

In 1971, about one-fifth of both black and white children 3 and 4 years old were in nursery school or kindergarten. Substantial proportions of black and white children 5 years of age were attending school. For both races, nearly all children of the compulsory attendance ages, 6 to 15 years old, were enrolled in school.

Table 61. Percent Enrolled in School by Age: 1965, 1967, 1969, and 1971

¹Negro and other races.

Blacks of high school age, 14 to 17 years old, were less likely to be enrolled in the modal grades for their age than were whites, in 1971. There was some evidence that for both races, males were more likely to experience grade retardation (2 or more years below mode) than were females.

Table 62. Percent of Enrolled Persons 14 to 17 Years Old In and Below Modal Grade, by Age: 1971

¹Modal grades are: 14 year olds, high school 1; 15 year olds, high school 2; 16 year olds, high school 3; 17 year olds, high school 4.

Between 1970 and 1971, the high school dropout rate for blacks 14 to 19 years old decreased. In 1971, the dropout rate for the young blacks was 11.1 percent, compared to the 1970 rate of 14.6 percent. However, blacks in this age group were still more likely than whites to be high school dropouts in both 1970 and 1971. The rate for whites was the same for both years--7.4 percent.

As high school teenagers grow older, the chances of them dropping out of school tend to become much greater. Among black males, nearly all of the 14 year olds were enrolled in school but among the 19 year olds, 29 percent had dropped out without completing their high school education.

Table 63. Percent High School Dropouts Among Persons 14 to 19 Years Old, by Sex and Age: 1970 and 1971

	1970				1971				
Age	Black		White		Black		White		
	Male	Female	Male	Female	Male	Female	Male	Female	
Total, 14 to 19 years	15.9	13.3	6.7	8.1	11.6	10.5	6.9	7.8	
14 years old	0.9 3.3 10.9 16.0 29.8 44.1	2.9 2.7 11.1 13.7 27.8 25.8	1.4 2.0 5.0 7.6 13.6 12.9	1.1 2.4 6.7 10.2 14.1 15.7	7.2	1.5 4.2	1.0 1.1 5.3 7.6 12.8 15.9	1.1 1.9 6.2 11.0 13.6 14.0	

Note: Dropouts are persons who are not enrolled in school and who are not high school graduates.

Among the young men 16 to 21 years old who were not enrolled in school, more than half, 57 percent, of the blacks and 38 percent of the whites had not completed their high school education.

For both black and white men not enrolled in school, those who were not high school graduates were more likely than the high school graduates to be unemployed or not in the labor force. However, this situation was more pronounced among blacks, among whom half of the men 16 to 21 years old who were school dropouts were not working or looking for work. The proportion was 34 percent for the comparable group of white men.

At the beginning of the 1960 decade, less than half of young black men and women, 25 to 29 years old, had completed high school. By 1971, 54 percent of the young black men of this age had achieved a high school education.

Among whites, about 80 percent of both young men and women completed high school in 1971.

¹Data for Negro and other races.

Young black adults have made gains in completing college. Between 1960 and 1971, the proportion of blacks, 25 to 34 years old, who had completed 4 or more years of college increased from 4 percent to 6 percent.

In 1971, as in the previous years shown, white men (25 to 34 years old) were more likely than white women to have completed college--21 percent and 13 percent, respectively. The proportion of black men completing college was not statistically different in 1971 from the comparable proportion of black women.

College attendance has increased among young blacks 18 to 24 years old. In 1971, 18 percent of the young blacks were enrolled in college as compared to about 10 percent in 1965. The proportion of young whites 18 to 24 years old attending college has remained relatively stable since 1965.

Table 67. College Enrollment of Persons 18 to 24 Years Old, by Sex: 1965 and 1971
(Numbers in thousands)

For both blacks and whites, college attendance for young adults tends to increase with family income. In 1971, of those black families with incomes under \$3,000 and with a family member 18 to 24 years old, 11 percent had at least one member enrolled in college compared to 36 percent for those families with incomes \$10,000 and over. Among whites at the upper income level, 51 percent of the families with college age members had one or more members enrolled in college.

V HOUSING

CONTENTS

Table	e	Page
71.	Tenure of Occupied Housing Units by Region: 1960 and 1970	91
72.	Tenure of Occupied Housing Units, Inside and Outside Metropolitan Areas: 1960 and 1970	92
73.	Number of Occupied Housing Units by Availability of Complete Plumbing Facilities: 1960 and 1970	93
74.	Percent of Occupied Housing Units, by Availability of Complete Plumbing Facilities, Inside and Outside Metropolitan Areas: 1960 and 1970	94
75.	Percent of Occupied Housing Units by Persons Per Room and Availability of Complete Plumbing Facilities: 1970	95
76.	Percent of Occupied Housing Overcrowded or Seriously Overcrowded, Inside and Outside Metropolitan Areas: 1970	96
77.	Percent of Households Having Selected Facilities or Equipment:	97

In 1970, about 6.2 million units were occupied by Negro households; approximately 56.5 million were occupied by white households. In 1970, a smaller proportion of Negro than white households lived in homes they owned or were buying--42 percent and 65 percent, respectively. In 1960, 38 percent of units occupied by Negro and other races were owned by the occupant, compared to 64 percent by whites.

The rate of owner occupancy was highest for Negro households in the South (47 percent) and for white households in the North Central Region (70 percent). Over the decade, increases in the rate of Negro homeownership occurred in the Northeast, North Central, and South. The increases, however, were more marked in the North Central and Southern Regions. In the North Central, the owner occupancy rate among Negro households rose from 36 percent to 42 percent; in the South, the proportion advanced from 42 to 47 percent. For the West, the homeownership rate was 40 percent for Negro households in 1970; the comparable rate in 1960 was 45 percent for households of Negro and other races.

Note: The 1960 data are for households of "Negro and other races."

.::3

- For both Negroes and whites, homeownership rates were higher in nonmetropolitan areas and suburbs (outside central cities) than in central cities.
- During the decade, for Negro households, the rate of owner occupancy increased in both the metropolitan and nonmetropolitan areas as well as in the central cities and suburbs. In the central cities, the homeownership rate was 35 percent in 1970; 31 percent in 1960. In the suburbs, where the homeownership rate was highest in both 1960 and 1970, the rates were 52 and 54 percents, respectively. The greatest change in owner occupancy rate occurred in nonmetropolitan areas—45 percent in 1960, 52 percent in 1970.

Outside metropolitan areas	1,435	742	52	693	17 ,971	12,955	72	5,016	

Note: The 1960 data are for households of "Negro and other races."

- Approximately 17 percent of the housing units occupied by Negroes lacked some or all plumbing facilities in 1970; 40 percent of the units occupied by Negro and other races households lacked such facilities in 1960.

Negro occupied housing units which lacked basic plumbing comprised a disproportionate share of all the occupied units which lacked such facilities. While Negro occupied housing units were 9.7 percent of all occupied housing units in 1970, Negro occupied units with incomplete plumbing comprised 27.6 percent of all the housing with incomplete plumbing. In 1960, the similar proportion was 27.0 percent for households of Negro and other races.

Table 73. Number of Occupied Housing Units by Availability of Complete Plumbing Facilities: 1960 and 1970

Year	With all facil	plumbing ities ¹	Lacking some or all plumbing facilities 1		
	Negro	White	Negro	White	
Number of occupied housing units:					
1960	² 3,048	42,190	²2,096	5 ,689	
1970	5,139	53,883	1,041	2,647	

^{&#}x27;"Complete (or basic) plumbing facilities" are a flush toilet and a bathtub or shower for the exclusive use of the occupants of the housing unit, and hot piped water. A housing unit is considered "lacking some or all plumbing facilities" if it does not have one or more of the facilities or if it has plumbing facilities which also are used by the occupants of another unit.

²Data are for households of "Negro and other races."

Between 1960 and 1970, the difference in the proportion of housing units with complete plumbing between Negro and white households was reduced considerably, most notably in the central cities. In 1970, as in 1960, the disparity in presence of complete plumbing was greatest in the nonmetropolitan areas where the rates for availability of complete plumbing were the lowest.

Table 74. Percent of Occupied Housing Units, by Availability of Complete Plumbing Facilities, Inside and Outside Metropolitan Areas: 1960 and 1970

(Metropolitan areas as defined in respective censuses)

Note: In this table, 1970 data are presented separately for "Negro" households and for households of "white and other races"; 1960 data are presented separately for "white" households and for households of "Negro and other races."

In 1970, 19 percent of Negro households lived in units with 1.01 or more persons per room compared to 7 percent of white households. The persons per room item is sometimes used as a measure of crowding. About 22 percent of Negro renter-occupied units had 1.01 or more persons per room while 16 percent of Negro owner-occupied units were so classified. Of the 3.6 million Negro renter-occupied units, 6 percent had 1.01 or more persons per room and lacked complete plumbing facilities; 4 percent had 1.51 or more persons per room and lacked complete plumbing facilities.

.....

The smallest percentage of overcrowding in Negro households, both owner and renter occupied, occurred inside central cities of metropolitan areas in 1970. Though the proportions were not nearly as high, the same pattern was noticeable for white owner-occupied units.

¹Includes persons of "other races."

In 1970, Negro households were less likely to have most major appliances than white households. The proportion of Negro households which had air conditioning is less than half that of white households; 18 percent for Negro compared to 39 percent for white. The proportion of white households which had an automobile available was 85 percent compared to 57 percent for Negro households.

In 1972, about 66 percent of families of Negro and other races had a husband and wife present. On the other hand, 30 percent of these families were headed by a woman. Approximately 88 percent of white families were husbandwife families and about 9 percent had a woman as the head. Little change has been observed in these proportions since 1950.

1972 ²	65.7	88.2	4.2	2.3	30.1	9.4

Note: Most of the tables in this section show data on families for the year 1971. Figures on families from the March 1972 Current Population Survey, which recently became available, have been included only in this table in this section.

A family consists of two or more persons living together and related by blood, marriage or adoption.

¹Female heads of families include widowed and single women, women whose husbands are in the armed services or otherwise away from home involuntarily, as well as those separated from their husbands through divorce or marital discord.

²Data from the March 1972 Current Population Survey are tied in with figures using 1970 census-based population controls. For a more detailed explanation, see "Revisions in Current Population Survey," Employment and Earnings, Vol. 18, No. 8 and forthcoming Current Population Reports, Series P-20 report on Households and Families.

Substantial proportions of both Negro and white women heads of families were separated or divorced. Approximately one-half of black women heads of families were separated or divorced, and about one-fourth were widowed. Among white women family heads, about equal proportions were separated or divorced or widowed.

Table 79. Marital Status of Female Heads of Families: 1971

Marital status	Negro	White

Note: Categories refer to marital status at time of enumeration. $\ensuremath{\mathsf{C}}$

Married women of Negro and other races are much more likely to be separated from their husbands than are white women. In 1971, the proportion of ever-married women who were divorced was greater for Negro and other races than for whites.

Note: Categories "Separated" and "Divorced" refer to marital status at time of enumeration.

NA Not available.

¹Excludes separations for reasons such as spouse being in Armed Forces, employed and temporarily living considerable distance from home, or inmate of institution.

In 1971, at the upper income level, \$15,000 and over, the proportion of black families headed by a man was similar to that for white families. At the under \$3,000 level, the percentage of black families with a man as the head was substantially below that for white families—40 percent for black families compared to 72 percent for white families.

Table 81. Families by Sex of Head and by Income: 1971

Family income in 1970	1	Negro		White			
	All families	Percent of all families		All families	Percent of all families		
	(thousands)		Female head	(thousands)	Male head	Female head

\$15,000 and over	468	94	6	10,998	97	3	

Between 1970 and 1971, the proportion of children of Negro and other races living with both parents decreased, continuing the decline which occurred between 1960 and 1970. By 1971, only about two-thirds, 64 percent, of children in these families were living with both parents. The comparable proportion of children of white family heads living with both parents was 90 percent.

Table 82. Own Children Living With Both Parents as a Percent of All Own Children: 1960 to 1971

Year	Negro and other races	White	
1960	7 5	92	
1961	76	92	
1962	73	92	
1963	70	92	
1964	71	92	
1965	71	91	
1966	71	91	
1967	73	92	
1968	69	92	
1969	69	92	
1970	67	91	
1971	64	90	

Note: Unmarried children under 18 years old living in families.

For blacks and whites, the proportion of children living with both parents varies with income levels. In 1971, at the \$10,000 to \$14,999 level, approximately 9 out of every 10 black children and 97 percent of white children were living with both parents. At the under \$3,000 family income level, only about one-fifth of all black children and one-half of all white children lived with both parents.

Table 83. All Own Children and Percent of Own Children Living With Both Parents, by Family Income; 1971

\$15,000 and over	687	85	14,345	97	

Note: Unmarried children under 18 years old living in families.

Between 1961 and 1968, the total fertility rates for women of all races have declined sharply. However, the decline in the total fertility rate was proportionately less for women of Negro and other races than for white women (29 percent as compared to 32 percent).

The total fertility rate of 3.13 children per black woman still is higher than that of 2.37 for white women.

Table 84. Total Fertility Rates: 1955 to 1968

Year	Negro and other races	Negro	White
1955	4.55 4.73 4.80 4.73 4.77 4.52 4.53 4.40 4.27 4.15 3.89	(NA) (NA) (NA) (NA) (NA) (NA) (NA) (NA)	3.45 3.55 3.63 3.56 3.57 3.53 3.50 3.35 3.20 3.07 2.79
1966 1967 1968	3.61 3.39 3.20	3.58 3.35 3.13	2.61 2.45 2.37

Note: Total fertility rate is defined as the number of births that 1,000 women would have in their lifetime if, at each year of age, they experienced the birth rates occurring in the specified calendar year.

Births 1955-59 adjusted for underregistration of births.

NA Not available.

¹Excludes data for New Jersey.

Source: U.S. Department of Health, Education, and Welfare and U.S. Department of Commerce, Social and Economic Statistics Administration, Bureau of the Census.

In 1971, the apparent difference in the average number of total births expected by young black wives (2.6) and young white wives (2.4) was not statistically significant. However, in the older age groups the expectations were significantly higher for Negro wives than white wives. Among wives 30 years and over, Negro wives expected an average of about four children as compared with about three among white wives, due largely to the fact that Negro wives in these ages had already borne more children than their white counterparts.

Table 85. Selected Data on Birth Expectations for Wives, 18 to 39 Years Old, of Household Heads: 1971

In 1971, the proportion of ever married black women, ages 15 to 44, with five or more children was more than twice that for white women, indicating the higher fertility among black women. About one-fourth of black women compared to approximately one-tenth of white women had five or more children.

Childlessness and one-child families were more frequent among black women 35 to 44 years old than among white women of the same age.

⁻ Represents zero or rounds to zero.

Between 1960 and 1971, the average number of children ever born declined markedly among black women 20 to 24 years old. This decrease reflects the sharp decline in the birth rate during the 1960's. At the other end of the childbearing span (35 to 44 years old), the average number of children ever born to black women increased during this period. Many of the women 35 to 44 years old lived much of their child-bearing period during the periods of high birth rates in the late 1940's and the 1950's.

B Base too small for rate to be shown.

¹Includes single women.

Since 1940, the number of illegitimate births of Negro and other races has exceeded the number of white illegitimate births, and the illegitimacy rate of Negro and other races has been several times as high as the white illegitimacy rate; however, these differentials have narrowed since 1960. The illegitimacy rate for Negro and other races, after nearly tripling between 1940 and 1961, declined by 14 percent between 1961 and 1968.

Note: As stated in the source cited, "No estimates are included for misstatements on the birth record or for failure to register births... The decision to conceal the illegitimacy of births is likely conditioned by attitudes in the mother's social group towards her and towards children born out of wedlock. Also, the ability (economic or otherwise) to leave a community before the birth of the child is an important consideration. These factors probably result in proportionately greater understatement of illegitimacy in the white group than in Negro and other races..."

Thirty-four States and the District of Columbia report legitimacy status on birth certificates. For the remaining States the illegitimacy ratio is estimated from the reporting States in each of the nine geographic divisions. The following States do not report legitimacy: Arizona, Arkansas, California, Colorado, Connecticut, Idaho, Maryland, Massachusetts, Nebraska, New Hampshire, New Mexico, New York, Oklahoma, Vermont, Georgia, and Montana. The last two States reported before

Source: U.S. Department of Health, Education, and Welfare.

¹Illegitimate births, regardless of age of mother, per 1,000 unmarried women 15 to 44 years old. ²Illegitimacy rate for 1940. ³Illegitimacy rate for 1950. ⁴Percent change, 1940 to 1955-1959.

The number of illegitimate births of Negro and other races per 1,000 unmarried women (illegitimacy rate) is much larger than the number for whites at every age level. However, the rate for Negro and other races declined substantially between 1960 and 1968 for all age groups 20 years and over, whereas the white rate rose for each age group during the same period.

Table 89. Estimated Illegitimacy Rates by Age of Mother: 1940, 1950, 1960, 1965, and 1968

 $^{^4}$ Rates computed by relating illegitimate births to mothers aged 35 and over to unmarried women 35 to 44 years old.

Among women ever married, Negroes were more likely than whites to be in the labor force. This was true regardless of the presence of children. About 47 percent of black mothers with young children worked as compared to 28 percent of white mothers. Among the women ever married who have no children under 5 years old, about 66 percent of the black women, as compared to 56 percent of the comparable group of white women, were in the labor force.

Labor force participation was greater among single white women than among black women.

Infant mortality rates have dropped sharply for both Negro and other races and whites during the past three decades. However, infant mortality rates for Negro and other races were much higher than those for whites in 1970.

Since 1965, the maternal mortality rate for mothers of Negro and other races and for white mothers has been very low--below 1.0 per 1,000 live births.

97.	The Projected 1972 Total and Black Population of Voting Age by State.	121

In both congressional election years, 1966 and 1970, about 60 percent of all blacks of voting age reported that they had registered to vote. Over the same period, the percentage of whites reporting that they had registered to vote dropped from 72 percent to 69 percent.

In the last presidential election year, 1968, about 66 percent of blacks of voting age reported they had registered to vote compared to about 75 percent for whites.

	53	62	58	64	71	65

Voter participation of blacks generally has been higher in the presidential election years (1964 and 1968) than in off-year elections. The voter participation rates, about 58 percent, in 1964 and 1968, were substantially higher than the proportions of 42 and 44 percent in 1966 and 1970, respectively. A similar pattern of voter participation was noted also for whites.

Voter participation of both blacks and whites in the United States remained relatively constant for the presidential election years of 1964 and 1968. However, this pattern varied by region. In the South, voter participation of blacks increased from 44 percent in 1964 to 52 percent in 1968. The comparable percents for whites in the South were 60 and 62 respectively.

Voter participation by blacks was lower than that for whites for the country as a whole in the four election years--1964, 1966, 1968, and 1970.

South	¹ 44	33	52	37	60	45	62	46

¹For Negro and other races.

The number of blacks elected to State office has risen sharply since 1964. In 1972, there were 206 State legislators, more than double the 94 in 1964. The growth has been greater for the South, where the number increased from 16 in 1964 to 78 in 1972 and, consequently, a greater share of all black State legislators are holding office in the South in 1972. In 1964, 17 percent of all black State legislators were in the South; in 1972 the comparable proportion was 38 percent.

Within the last four years, marked increases have been noted in the number of black mayors. In 1972, there were 86 mayors compared to 29 in 1968. In 1968, about 59 percent of all black mayors were located in the South. The proportion had dropped to about 51 percent in 1972.

Note: Figures for the years 1964, 1966, and 1968 represent the total number of elected blacks holding office at that time, not just those elected in those years. Figures for 1970 also include persons elected the first 3 months of 1971. The 1972 numbers represent elected officials holding office as of March 1972.

Source: Potomac Institute and Joint Center for Political Studies.

⁻ Represents zero. NA Not available.

¹Includes all black elected officials not included in first four categories.

There were 2,264 elected black officials in the United States in 1972. Most of the black elected officials held offices in city government or in law enforcement and educational type positions in 1972. The States with the largest number of black officials were New York, New Jersey, Ohio, Illinois, Michigan, North Carolina, Mississippi, Louisiana and California; all of which have at least 100 officials.

Projections of the voting-age population indicate that the black voting-age population will comprise 10 percent of the total electorate in 1972. Blacks will be 16 percent of the voting-age population in the South, as compared to 9 percent or less in the North and West.

Blacks will represent a large proportion of the younger than of the older voting-age population. Approximately 14 percent of the electorate under 25 years of age will be black compared to 8 percent of those 65 years and over.

Table 96. Projected Black Population as a Percent of the Voting-Age Population in the United States and Regions, by Age: 1972

Age	United States	North- east	North Central	South	West
18 years and over	10.0	8.5	7.6	16.4	4.6
Under 25 years	13.6 10.6 8.9 7.9	11.4 10.5 7.0 5.1	10.1 8.4 6.7 5.3	22.3 15.9 15.4 15.2	6.1 5.1 4.0 2.8

Of the 139 million persons of voting age in November 1972, about 14 million will be black. In the District of Columbia, almost 70 percent of the voting-age population will be black. The blacks will represent from 22 to 30 percent of the total electorate in five Southern States--South Carolina, Georgia, Alabama, Mississippi, and Louisiana.

. Of the 26 cities with a black population of 100,000 or more in 1970, three cities had a black majority. In six cities, the blacks represented 40 to 50 percent of the total population.

The black population was relatively young in all of the cities. Over a third of the blacks were under 18 years of age in these places. Milwaukee has the largest proportion (49 percent) of blacks under 18 years of age.

All but one of the 26 selected cities with 100,000 or more blacks experienced an increase in the black population between 1960 and 1970. Migration gains accounted for at least half the growth of Negro and other races in eight cities, six of which are in the North and West. Among the eight places, New York and Boston showed the greatest percentage increase in the population due to migration, followed closely by Dallas and Milwaukee.

Seven cities had an out-migration of Negro and other races, but only one city, Birmingham, had a population loss of Negro and other races due to out-migration.

⁻ Rounds to zero.

¹Base is population at beginning of period.

The majority of black families in all of the selected cities had a head and wife present. The proportion of families with both head and wife present was about the same or higher in eight of the cities than the proportion of 67 percent for all black families in the United States. In all of the 26 cities, at least one-fourth of the families had children (own children) in the household who were under 6 years old. In two cities, Boston and Milwaukee, the proportion was 4 out of 10.

There is some evidence that the average number of children ever born per ever married woman 35 to 44 years old was higher for black women in New Orleans, Memphis, Birmingham, and Milwaukee than for the remaining 22 cities.

Nearly two-thirds of the under 18 black population in Houston and three-fifths of those in Indianapolis were living with both parents. In the remaining cities, except Boston and Pittsburgh, about half of black persons under 18 years of age were living with both parents.

In only one city, Indianapolis, of the 26 selected cities, was the proportion black of all children enrolled in public elementary schools less than one-fourth. In Washington, D.C., almost all (93 percent) of the elementary school children were black. In the remaining 24 cities, black children represented a majority of those in public elementary school in 13 places, and were less than half of the public school population in 11 places.

Boston and Los Angeles had the lowest proportions (5 and 6 percents, respectively) of black persons 25 years old and over that were functional illiterates. Birmingham, Jacksonville, and Memphis led the group with more than 16 percent.

Los Angeles was the only city in which half of the adult black population (25 years old and over) were graduates of high school. For this category, the proportion for other cities, with the exception of Memphis, was over one-fourth.

Washington, D.C. and Atlanta had the highest proportions of college graduates-8 and 7 percents. respectively.

Among the selected cities, the three cities, Washington, D.C., Newark, and Atlanta, which had a majority black population, also had the highest proportions of blacks in their employed labor force--68, 48, and 47 percents, respectively.

Washington, D.C. ranked highest in the proportion (15 percent) of blacks employed in professional, technical, and managerial occupations, followed closely by Los Angeles, Boston, Columbus, and New York. In all the cities, the proportion of black workers employed as craftsmen and foremen ranged from about 6 to 10 percent.

There was a scarcity of self-employed black persons in all of the cities. The maximum percentage of self-employed of all black workers was 1 percent in seven cities.

Oakland experienced the highest unemployment rate of 12 percent in 1970, whereas Washington, D.C. and Richmond had the lowest --4 percent. Detroit and Los Angeles each had an unemployment rate of 10 percent.

⁻ Represents zero or rounds to zero.

Black families and persons in Washington, D.C. and Detroit had the highest incomes in 1969. Forty percent of the black families in each of these two cities had incomes of \$10,000 and over. The median incomes for black families in Detroit and Washington, D.C. were \$8,600 and \$8,500, respectively. The per capita income for black persons, which takes into account variation in size of families between cities, was \$2,700 for Washington and \$2,500 for Detroit.

In six cities, the median family income was about or below the national average of \$6,100 for black families. The cities were Pittsburgh, Birmingham, Memphis, Jacksonville, New Orleans, and Richmond. The low median income was reflected in the low proportion of black families with incomes of \$10,000 and over in each of these six cities.

The per capita income for black persons was about or below the average of \$1,800 for all black persons in the country for seven cities--Dallas, Houston, Birmingham, Jacksonville, New Orleans, Memphis, and Richmond. The seven cities are located in the South where incomes were generally lower than those in the rest of the country.

Nationally, in central cities of metropolitan areas, the median income of black families was about 71 percent of all families in 1969. The median income of black families as a percent of that for all families was above the national central city figure of 71 percent for the majority of the cities with a substantial black population of 30 percent or more. In contrast, among the 12 cities with under 30 percent black population, only two had percentages above the national level.

About four out of every ten black persons in New Orleans, Memphis, Birmingham, and Jacksonville were poor in 1969. The proportions for these four cities were above the poverty rate of 31 percent for black urban persons. The lowest proportions below the low-income level were recorded for Washington, D.C., Detroit, and Indianapolis. Among the 26 cities this same pattern existed for black families in the low-income category.

In all the cities except three, the majority of the low-income families were headed by a woman. A high proportion, about 73 percent, was found in Boston; low proportions were for Birmingham, Memphis, and Houston-about 50 percent.

In only one of the 26 cities with the largest black population, Washington, D.C., did blacks represent more than half of the total voting-age population in 1971. In two of these cities (Newark, N.J. and Atlanta, Ga.) blacks represented almost one-half of the population of voting age. Additionally, in nine other cities the proportion of blacks ranged from about 30 to 40 percent.

In 1970, homeownership rates among Negro households in the Nation's 26 cities with the largest black population ranged from 15.7 percent in Newark, N.J., to 55.0 percent in Kansas City, Mo. The proportion of Negro households living in housing which lacked basic plumbing facilities ranged in these cities from 1.5 percent in Baltimore, Md. to 14.6 percent in Jacksonville, Fla.

Note: See note on "plumbing facilities" definition, table 73.

In 1970, the median value of Negro owner-occupied units varied from \$8,500 in Jacksonville and Philadelphia to \$22,000 in New York City. The median contract rent varied from about \$40 in Birmingham to about \$110 in Newark and Chicago.

Among the 26 cities there were wide ranging differences in selected characteristics of Negro occupied units. For example, Baltimore registered the high of 22.9 percent in units with more than 1 bathroom and Boston a low of 6.8 percent. The proportions of units with 3 or more bedrooms ranged from 20.3 percent in Los Angeles to 55.5 percent in Philadelphia. As a matter of fact, in fifteen of the cities at least 33 percent of the occupied units had 3 or more bedrooms.

The highest percentage of housing units in multiunit structures were found in New York City--70.9 percent, and the lowest in Jacksonville--8.0 percent.

Atlanta led in cities with units built during the 1960's-- 28.8 percent. In all cities except three, New York, Philadelphia, and Birmingham, indications were that 20 percent or more of the occupants moved into their living quarters between 1969 and 1970.

Among the 30 places with the highest proportion of blacks in 1970, the number that have at least as many blacks as whites has increased to 16 from the count of 3 in 1960. Most of the 16 cities experienced sharp increases in the proportionate black population since 1960. Only one city, Bessemer, Ala., showed a decline.

While blacks represented more than half of the total population in 16 places, they were a majority of the voting-age population (18 years and over) in only 8 places. Blacks were slightly less than half (45.0 to 49.9 percent) of the population of voting age in 10 places, 40.0 to 44.9 percent in six places, and under 40 percent in the remaining six cities. Since blacks are a much younger population than whites, they are generally a lower percentage of the voting-age population than of the total population.

Note: Thirty places were selected from places with a total population of 25,000 or more and Negro population of at least 10,000.

X Not applicable.

About 4.3 million blacks 16 years old and over were living in selected low-income urban areas of the country at the time of the Census Employment Survey (August 1970 thru March 1971). They comprised about 50 percent of all persons in the same age group living in these selected areas.

The teenage and very young adult population (16 to 24 years) were about one-fourth of the population 16 years old and over in low-income urban areas. About 11 percent could be considered the aged population--65 years and over. Less than half of the population (43 percent) in the specified areas were married and living with a spouse. Approximately 17 percent were widowed or divorced.

Of those 25 to 34 years old, 55 percent were high school graduates. A very small proportion (6 percent) had less than an elementary school education. There were approximately one and one-half million full-time year-round workers with median annual earnings of \$6,400 for black men and \$4,300 for black women.

Los Angeles had the highest proportion (71 percent) of high school graduates, 25 to 34 years old, followed by 62 percent for Detroit. At least half of the young adults in all of the other cities except Baltimore and Chicago had a high school education.

Note: Statistics on low-income areas are based on information gathered in the Census Employment Survey (CES) conducted as part of the overall program of the 1970 Census of Population and Housing. Interviewing for CES began August 1970 and was completed by March 1971. The period of interviewing in the selected low-income areas differed considerably by city, and some cities were completed even before others began.

The low-income areas were identified on the basis of several criteria--census tracts with a high proportion of families with "low income" in 1960, and other more recent socio-economic data, along with the views of local knowledgeable agencies. For a more detailed explanation, see Employment Profiles of Selected Low-Income Areas, Series PHC (3).

¹Includes selected low-income areas in 44 other cities, not shown separately.

²Includes married, spouse present in Armed Forces.

Source: U.S. Department of Commerce, Social and Economic Statistics Administration, Bureau of the Census.

About 63 percent of the 1.6 million black families living in selected low-income areas were headed by men and 37 percent were headed by women. The disparity in economic levels between families headed by a man or woman is reflected in their median family income. In those families headed by a woman, the median income was \$3,900, approximately half the \$7,800 for families headed by a man.

About two-thirds of all black families in these areas had children under 18 years old.

In the selected low-income areas, approximately four-fifths of low-income family heads worked sometime during the year preceding the survey and over half were year-round full-time workers. About 21 percent of the family heads did not work during that period.

Among the seven selected cities with low-income urban areas, Washington, D.C. and Detroit had the highest proportion of men as heads of families-about 68 percent.

At the time of the survey, about 1.1 million poor black persons, 16 years old and over, were living in the selected low-income areas of the urban areas of the country. These black persons represented about one-fourth of the black adult population in the selected low-income areas.

The highest proportion of poor blacks in selected low-income areas was found in Chicago where about one-third of those 16 years old and over were below the low-income level.

Note: Statistics on low-income areas are based on information gathered in the Census Employment Survey (CES), conducted during the period August 1970 to March 1971.

See note on low-income concept, table 25. For the period covered by the CES, the low-income threshold was about \$3,880 for a nonfarm family of four, headed by a male with a wife and two children under 18, and \$6,904 for a nonfarm family with a male head and with 7 or more persons (none under 18 years old).

Source: U.S. Department of Commerce, Social and Economic Statistics Administration, Bureau of the Census.

¹Includes selected low-income areas in 44 other cities, not shown separately.

Approximately 438,000, or 27 percent, of the black families living in selected low-income areas were poor. The proportion of persons who were below the low-incomelevel in these areas was only slightly higher than the 26 percent for all urban areas in the country in 1969. About two-thirds of the poor families in the low-income areas were headed by women.

A very large portion of the black families below the low-income level and residing in the designated areas had children to support. About 8 out of every 10 families had children under 18 years old, and 5 out of every 10 had preschool age children.

Slightly less than half of those below the low-income level in the working age group (16 to 64 years old) who were heads of families, held a job sometime during the year preceding the survey. About one-fifth worked year round.

Among the seven cities, Chicago had the highest proportion of families below the low-income level within the selected low-income areas. Substantially more than half of these families were headed by women in all seven cities. The proportion of the poor families with children under 18 was lowest in Detroit-74 percent.

In each city, less than half of the low-income heads of families living in the specified areas worked sometime during the 12-month period prior to the survey. Small proportions worked year round; the highest proportion (25 percent) was observed for Washington, D.C.

¹Includes selected low-income areas in 44 other cities, not shown separately.

At the time of the Census Employment survey, 2.5 million, or 64 percent, of black persons 16 to 64 years old in selected low-income urban areas were in the labor force. About 49 percent were working full time and 8 percent part time.

About 280,000 black persons in the low-income urban areas were without a job, but looking for work. The unemployment rate of 11.1 percent was above the national average for black persons. The unemployment rate among black men in the specified areas (10.2 percent) was lower than the 12.3 percent for the comparable group of black women. In addition to those unemployed (without a job, but actively seeking a job), a large group of persons desired work, but were unable to seek it. In the selected low-income areas, about 932,000 black persons 16 to 64 years old, or 68 percent of those not in the labor force, desired employment. Almost half of those persons not in the labor force cited family responsibilities or illness and disability as the reason for not actively seeking employment.

Unemployment among the youth was high--about a third of those 16 to 21 years old were looking for work.

Among the seven cities, unemployment for persons 16 years and over was worst in the selected low-income areas of Los Angeles and Detroit. In the comparable areas of Washington, D.C., the unemployment rate was strikingly low. In each city more than half of the persons living in the specified areas were in the labor force.

Note: Statistics on low-income areas are based on information gathered in the Census Employment Survey (CES), conducted during the period August 1970 to March 1971.

¹Includes selected low-income areas in 44 other cities, not shown separately.

Source: U.S. Department of Commerce, Social and Economic Statistics Administration, Bureau of the Census.

There were 284,000 unemployed blacks in selected low-income urban areas of the country. Most of the black unemployed (83 percent) were looking for full-time work. A substantial proportion (about one-third) had experienced long-term unemployment (15 weeks or more).

About half of the jobless in these specified areas were entering or returning to the labor force. However, at least one-third of the black unemployed had lost or had been laid off from the last job.

About one-half of unemployed black persons (16 to 64 years old) indicated that they had at least one problem in finding a job. Lack of skill, experience, or education were the most common reasons cited for not being able to find a job.

Among blacks in the specified areas of the seven cities, unemployed persons in Los Angeles were most likely to have been out of work for a long time (15 weeks or more). On the other hand, the blacks who were jobless in Washington, D.C., Baltimore, and Chicago were least likely to have experienced long-term unemployment. The proportion of unemployed persons who lost or were laid off from their last job was lowest in Washington, D.C. (about 20 percent) and highest in Philadelphia and New York (about 50 percent).

Source and Reliability of the Data

Source of data. Most of the estimates in this report are based on data from the decennial censuses of population, the Current Population Survey, the Survey of Economic Opportunity, and the Census Employment Survey, all of which were conducted by the Bureau of the Census. Other data were provided by various governmental agencies including the Bureau of Labor Statistics, Department of Labor; the Department of Health, Education, and Welfare; the Civil Service Commission; the Internal Revenue Service; and the Equal Employment Opportunity Commission. Additional information was provided by a number of non-governmental sources; a complete list of sources for the tables is shown on pages of this report.

Decennial Census of Population. Decennial census data in this report are based on complete counts or on the samples associated with the census as indicated in the list of sources. All data in this report from the 1950 or earlier decennial censuses are based on complete counts. Descriptions of the 25 percent sample from the 1960 census and the 5, 15, and 20 percent samples from the 1970 census are found in the appropriate census publications. The 1960 1-in-1,000 sample is a stratified systematic sample of .001 of the households enumerated in the 1960 census.

Current Population Survey (CPS). Data collected from the Current Population Survey (CPS) from 1967 to the present are based on a sample spread over 449 areas comprising 863 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Approximately 50,000 occupied households are eligible for interview each month. Of this number, 2,250 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 50,000, there are also about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not to be interviewed.

Data collected in 1962 through 1966 from the CPS were based on a sample spread over 357 areas comprising 701 counties and independent cities with coverage in each of the 50 States and the District of Columbia; approximately 35,000 occupied households were eligible for interview each month. Data collected from May 1956 to 1962 were based on a sample spread over 330 areas comprising 638 counties and independent cities with coverage in the then 48 States and the District of Columbia; approximately 35,000 occupied households were eligible for interview each month. Data collected from February 1954 to May 1956 were based on a sample spread over 230 areas comprising 453 counties and independent cities with coverage in 47 States and the District of Columbia; approximately 21,000 households were eligible for interview each month. Data collected before February 1954 were based on a sample spread over 68 areas comprising 125 counties and independent cities with coverage in 42 States and the District of Columbia; approximately 21,000 households were eligible for interview each month.

The estimating procedure used in the Current Population Survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from the previous decennial census of population, statistics of births, deaths, immigration and emigration, and statistics on the strength of the Armed Forces.

Survey of Economic Opportunity. The 1967 Survey of Economic Opportunity sample was interviewed in the 357 area sample design, used for CPS from 1962 through 1966, but the sample selected within these areas differed in size and composition. Approximately 29,000 occupied households were eligible for interview. Of this number about 2,500 of the occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. In addition to the 29,000, there are also about 6,000 sample units which were visited but were found to be vacant or otherwise not to be interviewed.

The sample was selected to have a disproportionately large sample of Negroes. The weights applied to each sample case were adjusted to reflect this. This sampling procedure results in more reliable estimates for Negroes but at the expense of reduced reliability for estimates of totals for all races and for estimates of whites. The estimation procedure was similar to the one used for CPS.

Census Employment Survey. The Census Employment Survey (CES) was conducted as a part of the 1970 Census of Population and Housing. The survey was developed to obtain detailed socio-economic information on employment-related problems in 60 selected areas in 51 of the nation's largest cities. In all the urban areas combined, a total of about 211,000 addresses were assigned for interview. Of this number, about 39,000 were found to be vacant or otherwise not to be interviewed. Each area had an assigned sample of about 3,500 units.

The estimating procedure involved a ratio estimate to 1970 census counts. Because of differing definitions of the eligible universe, no ratio estimation was performed for persons age 16 to 24.

Reliability of the Estimates. Estimates based on a sample may differ somewhat from the figures obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. The chances are about 68 out of 100 that an an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by the use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in all the standard error tables are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items (for a given subject matter) and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provided are an indication of the order of magnitude of the standard errors for a given subject matter rather than the precise standard error for any specific item.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more.

Data obtained from the Current Population Surveys, Decennial Censuses, Survey of Economic Opportunity, Census Employment Survey and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in the differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Data based on the CPS sample. Tables of standard errors for estimates and percentages for characteristics pertaining to total or white population (Tables A and C) and to Negro and other races (Tables B and D) are presented below.

Table A. Standard Errors of Estimated Numbers, Total or White Population

Current Population Survey

(68 chances out of 100)

Size of estimate (thousands)	Standard error (thousands)	Size of estimate (thousands)	Standard error (thousands)
25	10 14 23	25,000	71 100 138 204 253

Table B. Standard Errors of Estimated Numbers, Negro and Other Races

Current Population Survey

(68 chances out of 100)

10	5	250	26
25	8	500	37
35	10	1,000	51
50	12	2,500	76
75	14	5,000	96
100		10,000	96

Table C. Standard Errors of Estimated Percentages, Total or White Population

Current Population Survey

(68 chances out of 100)

Estimated	Base of percentage (thousands)										
percentage	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000	
2 or 98	2.0	1.3	0.9	0.6	0.4	0.3	0.2	0.1	0.1	0.1	
5 or 95	3.1	2.0	1.4	1.0	0.6	0.4	0.3	0.2	0.1	0.1	
10 or 90	4.3	2.7	1.9	1.4	0.9	0.6	0.4	0.3	0.2	0.1	
25 or 75	6.2	3.9	2.8	2.0	1.2	0.9	0.6	0.4	0.3	0.2	
50	7.2	4.5	3.2	2.3	1.4	1.0	0.7	0.5	0.3	0.2	

Table D. Standard Errors of Estimated Percentages, Negro and Other Races

Current Population Survey

(68 chances out of 100)

Estimated	Base of percentage (thousands)										
percentage	50	100	250	500	1,000	2,500	5,000	10,000			
2 or 98 5 or 95	3.3 5.1	2.3 3.6	1.5 2.3	1.0 1.6	0.7 1.2	0.5 0.7	0.3 0.5	.0.2			
10 or 90 25 or 75	7.1	5.0 7.2	3.2 4.6	2.2	1.6 2.3	1.0	0.7 1.0	0.4 0.5 0.7			
50	11.8	8.4	5.3	3.7	2.6	1.7	1.2	0.8			

Table E presents factors which are to be applied to the figures in tables A, B, C, and D, to produce standard errors for the various subject matter areas. For example, to produce approximate standard errors for total or white estimates for low-income persons based on data collected in the CPS after January 1967, multiply the appropriate figures in tables A or C by the factor 1.8. These tables present approximate sampling errors for all estimates based on the CPS and the 1-in-1,000 sample from the 1960 census.

Illustration: The source of table 79 of this report is the Current Population Survey. The table shows that in 1971 there were 5,892,000 female heads of families. Table A shows the standard error on an estimate of this size to be approximately 107,000. Table E shows the factor for estimates of household and family characteristics for families is 0.8. Applying this factor to the figure from table A provides an approximation to the standard error of this estimate of about 86,000. This means the chances are about 68 out of 100 that the estimate would have differed from a complete census figure by less than 86,000. The chances are 95 out of 100 that the estimate would differ from a complete census figure by less than 172,000.

Of these 5,892,000 female heads, 1,506,000 or 25.6 percent, are black women. Interpolation in table D shows the standard error of 25.6 percent on a base of 5,892,000 to be approximately 0.9 percentage points. Table D rather than table C is used in this instance as the numerator of the estimated percentage is a Negro characteristic. Table E shows the factor for household and family characteristics for family data is 0.8. Applying this factor to the standard error obtained from table D provides an approximation to the standard error of the 25.6 percentage of approximately 0.7 percentage points. Consequently, chances are 68 out of 100 that the estimated 25.6 percent would be within 0.7 percentage points of a complete census figure and chances are 95 out of 100 that the estimate would be within 1.4 percentage points of a complete census figure, i.e., this 95 percent confidence interval would be from 24.2 to 27.0 percent.

Data based on 1960 census 1-in-1,000 sample. Standard errors for data based on the 1960 census 1-in-1,000 sample are estimated by applying the factor given in the right hand column of table E to the standard errors shown in tables A, B, C or D as appropriate.

Data based on 1970 Census Employment Survey. Tables F and G show standard errors for estimated numbers and percentages for the combined total for all areas covered in the Census Employment Survey. Because of the estimation procedure used in each area, it is necessary to consult the appropriate CES publication for the standard errors for an area. To illustrate, tables H and I show standard errors for estimated numbers and percents for CES data for the Washington, D.C. low-income areas. Tables F, G, H, and I are used to approximate the standard errors of CES estimates in the same manner as tables A, B, C, and D are used for the CPS. There is no table equivalent to the factor table E used in estimating the CES standard errors.

⁻ Represents zero.

¹Factors found in this column should also be used for unrelated individuals.

²The factor for persons for the 1-in-1,000 sample of the 1960 Decennial Census should be used for characteristics which occur for either everyone or no one in a household, e.g., the factor for persons should be used for the number of persons below the low-income level. The factor for families for this data should be used for all other characteristics.

³Factors for total or white are to be used with tables A or C and the factors for Negro and other races are to be used with tables B or D.

⁴Standard errors for estimated fertility rates are given in table M.

Data based on samples from the 1970 Decennial Census. Tables J and K in conjunction with the factor table L are used to approximate standard errors for data from the 1970 census 5, 15 or 20 percent samples.

Table J. Approximate Standard Error of Estimated Number Based on 20-Percent Sample

1970 Decennial Census

(Range of 2 chances out of 3:for factors to be applied, see table L and text)

Estimated number 1	Standard error
50	15 20 30 45 65
2,500	100 140 200 240 320
50,000	450 540 630

¹For estimated numbers larger than 100,000, the relative errors are somewhat smaller than for 100,000.

Table K. Approximate Standard Error of Estimated Percentage Based on 20-Percent Sample

1970 Decennial Census

(Range of 2 chances out of 3:for factors to be applied, see table L and text)

Estimated percentage	Base of percentage						
	500	1,000	2,500	10,000	25,000	100,000	250,000
2 or 98	1.3 2.0 2.7 3.9 4.5	0.9 1.4 1.9 2.7 3.2	0.6 0.9 1.2 1.7 2.0	0.3 0.4 0.6 0.9	0.2 0.3 0.4 0.5	0.1 0.1 0.2 0.3	0.1 0.1 0.1 0.2 0.2

Illustration: Table 102 shows the number of employed blacks in the city of Kansas City, Missouri to be about 42,000. Interpolation in table J gives an approximate standard error of 408 for this estimate. Table L shows that both race and employment status are 20 percent samples; however, the factors differ and the larger of the two should be used (1.6 for race because the area is not in the South). Applying this factor to the 408, the standard error for the estimate is 653. This means the chances are 68 out of 100 that the estimate would differ from a complete census figure by less than 653. The chances are 95 out of 100 that the estimate would differ from a complete census figure by less than 1,306.

Of the 42,000, approximately 12 percent are employed as professionals, technicians, or managers. Table K shows the standard error of 12 percent on a base of 42,000 to be approximately 0.4 percentage points. Table L shows the factor for race is larger than the factor for occupation. Applying the race factor of 1.6, the standard error on the estimated 12 percent is found to be about 0.6 percentage points. The chances are 68 out of 100 that the estimated 12 percent would be within 0.6 percentage points of a complete census figure and the chances are 95 out of 100 that the estimate would be within 1.2 percentage points of a complete census figure, i.e., the 95 percent confidence interval would be from 10.8 to 13.2 percent.

Table L. Factor to be Applied to Tables J and K to Estimate Standard Errors for 1970 Census Sample Data

Population subjects	Sample rate (percent)	Factor	Housing subjects	Sample rate (percent)	Factor

Fertility rates. Table M shows standard errors of estimated fertility rates of women in a given class. Factors are also given which should be applied to table M to obtain standard errors for Negro women or for data based on other years. The sampling variability of the ratio of children per 1,000 women depends on the shape of the distribution on which the rate is based, the size of the sample, the sample design and the use of ratio estimates.

Illustration: Table 86 of this report shows that in 1971, there were 569,000 Negro women ever married who were 20 to 24 years old. Table 87 shows these women had an average of 1.6 births per woman or about 1,600 children per 1,000 women. Table M shows the standard error of a rate of 1,600 children on a base of 569,000 women to be approximately 92. Since this rate is for 569,000 black women (which is less than 2,000,000) a factor of 1.1 should be applied to this standard error to produce the final standard error of 101. This means the chances are 68 out of 100 that the estimate would have shown a fertility rate differing from a complete census figure by less than 101. The chances are 95 out of 100 that the estimate would have shown a fertility rate differing from a complete census figure by less than 202 (twice the standard error); i.e., the 95 percent confidence interval would be between 1,398 and 1,802 children ever born per 1,000 black women ever married, age 20 to 24.

Table M. Standard Errors of Estimated Fertility Rates

Children ever born per 1,000 women Number of women 1,000 1,500 2,000 2,500 3,000 3,500 4,000 250,000.... 500,000.... 750,000.... 1,000,000... 2,000,000... 5,000,000... 10,000,000.. 15,000,000... 20,000,000.. 25,000,000...

(68 chances out of 100)

Note: For 1969 CPS data, multiply these standard errors by a factor of 1.0 for total or white women and for Negro women where number of women is greater than 2,000,000. Use a factor of 1.1 for Negro women where number of women is 2,000,000 and smaller.

For 1967 Survey of Economic Opportunity data, use a factor of 1.6 for total or white and 1.2 for Negro women.

For 1970 census data use the factor of 0.1.

Standard errors of estimated medians. The sampling variability of an estimated median depends upon the form as well as on the size of the distribution from which the median is determined. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence the median based on a complete census lies within the interval. Estimating the upper and lower limits of the interval (that is, the confidence limits) about a median is described using the following illustration which is based on data from the CPS sample.

Table 17 shows the median income of the 5,413,000 families of Negro and other races was \$6,516 in 1970. This information is derived from the CPS. To establish 68 percent confidence intervals about this median, the following steps are performed:

- 1. Using table D and the appropriate factor from table E, compute the standard error of a 50 percent estimate on a base of 5,413,000. This standard error is found to be 0.7 percent.
- 2. Cumulate the frequencies in table 17 and interpolate to find the point in the distribution below which 50 0.7 percent of the families fall. This shows that the families with incomes less than \$6,538 account for 50 0.7 or 49.3 percent of the distribution. This is the lower bound of the 68 percent confidence interval about the median.
- 3. In a corresponding way, cumulate the frequencies in table 17 and interpolate to find the point in the distribution below which 50 + 0.7 percent of the families fall. This shows that the families with incomes less than \$6,713 account for 50.7 percent of the distribution. This is the upper bound of the 68 percent confidence interval about the median.
- 4. The above shows the 68 percent confidence interval about the median of \$6,516 is from \$6,538 to \$6,713. The 95 percent confidence interval is obtained by steps as above but using twice the standard error of the 50 percent estimate as found in step 1. This will show the 95 percent confidence interval for this illustration is \$6,450 to \$6,800.
